

THE CENSUS PUBLICATIONS

THE CENSUS PUBLICATIONS FOR WEST BENGAL, SIKKIM AND CHANDERNAGORE will consist of the following volumes. All volumes will be of uniform size, demy quarto $8\frac{3}{4}'' \times 11\frac{1}{4}''$:—

PART IA—GENERAL REPORT by A. Mitra, containing the first five chapters of the Report in addition to a Preface, an Introduction and a bibliography. 609 pages.

PART IB—VITAL STATISTICS WEST BENGAL, 1941-50, by A. Mitra and P. G. Choudhury, containing a Preface, 60 tables and several appendices. 75 pages.

PART IC—GENERAL REPORT by A. Mitra, containing the Subsidiary tables of 1951 and the sixth chapter of the Report and a note on a Fertility Inquiry conducted in 1950. Several appendices. A report on the natural resources, trades and industries of the State with a bibliography by Chanchal Kumar Chatterjee and Kamal Majumdar. About 450 pages.

PART II—UNION AND STATE CENSUS TABLES OF WEST BENGAL, SIKKIM AND CHANDERNAGORE by A. Mitra. 540 pages.

PART III & IV—REPORT WITH CENSUS TABLES ON CALCUTTA CITY AND CALCUTTA INDUSTRIAL AREA by A. Mitra. About 250 pages.

PART V—ADMINISTRATIVE REPORT OF THE CENSUS OPERATIONS OF WEST BENGAL, SIKKIM, CHANDERNAGORE AND CALCUTTA CITY : ENUMERATION : by A. Mitra. 96 pages.

THE TRIBES AND CASTES OF WEST BENGAL—edited by A. Mitra, containing 1951 tables of Scheduled Castes and Scheduled Tribes in West Bengal. A monograph on the Origin of Caste by Sailendranath Sengupta, a monograph on several artisan castes and tribes by Sudhansu Kumar Ray, an article by Professor Kshitishprasad Chattopadhyay, an article on Dharmapuja by Shri

Asutosh Bhattacharyya. Appendices of Selections from old authorities like Sher-
ring, Dalton, Risley, Gait and O'Malley.
An Introduction. 410 pages and 18 plates.

AN ACCOUNT OF LAND MANAGEMENT IN WEST BENGAL, 1872-1952, by A. Mitra, containing extracts, accounts and statistics over the 80-year period and agricultural statistics compiled at the Census of 1951, with an Introduction. About 250 pages.

FAIRS AND FESTIVALS IN WEST BENGAL by A. Mitra, containing an account of fairs and festivals classified by villages, unions, thanas and districts. With a foreward and extracts from the laws on the regulation of fairs and festivals. 45 pages.

DISTRICT HANDBOOKS FOR EACH WEST BENGAL DISTRICT by A. Mitra. Each volume contains an Introductory essay, bringing the old Gazetteer up to date, several important appendices, and about 82 tables, together with a list of ancient monuments in each district. Contains also a village directory where the J. L. No. of every village, its name, area, total population, number of houses, number of literates and population classified into eight livelihood classes are tabulated. The whole series is expected to be complete by 1954. Each volume will contain about 300 pages (14 volumes).

A CATALOGUE OF THE BETTER KNOWN ANCIENT MONUMENTS OF WEST BENGAL by A. Mitra. Will contain brief descriptions of extant ancient monuments in each district of the State, dating up to 1800, with exact location and present state. Translations of all inscriptions found in West Bengal and an account of all invasions or conquests of Bengal mentioned in inscriptions. With many plates. About 600 pages.

ACKNOWLEDGEMENTS

For the entire matter of the Introductory Essay acknowledgements are due to F. W. Strong's Gazetteer of the District of Dinajpur (1912), to F. O. Bell's Final Report on the Survey and Settlement Operations in the district of Dinajpur (1942), to W. W. Hunter's Statistical Account of Dinajpur (1876) to Dr. Francis Buchanan-Hamilton's Statistical Account of the Zila of Dinajpur (1808) to E. V. Westmacott's The Dinajpur Raj, Journals of the Asiatic Society of Bengal, the Bengal Records, and the periodical reports of the various departments of the Government of Bengal; for the Series 1 tables to the Census Office of West Bengal; for Series 2 to the Directorate of Health Services, West Bengal, and particularly to Dr. P. G. Choudhury, Assistant Director of Health Services (Vital Statistics); for Series 3 to the Directorate of Agriculture, West Bengal, and particularly to Dr. L. A. Ramdas, Director of Meteorology, Poona; for Series 4 to the Census Office of West Bengal and to the State Statistical Bureau; for Series 5 to the Commissioner of the Presidency Division, the Deputy Inspector General of Police, Northern Range, the District Magistrate and the Superintendent of Police of West Dinajpur, and the State Statistical Bureau; for Series 6 to the Directorate of Education, the District Inspector of Schools for West Dinajpur, the Census Office, and the State Statistical Bureau; for Series 7 to the Directorate of Health Services; for Series 8 to the Commissioner of the Presidency Division and to the public bodies concerned; for Series 9 to the Postal Department and the District Board of West Dinajpur and for Series 11 to the Census Office, West Bengal. I wish to express my obligations to Srijuts R. Banerjee, I.A.S., B. C. Ganguli, I.A.S. and S. K. Banerjee, M.C., I.A.S., District Magistrates between 1950 and 1953, for much valuable help. I have acknowledged other debts in the body of the volume.

CONTENTS

Introducing the district	i—xxxiii
Outline map of the district showing population by police station	xxxiv
Appendices—	
I. Gazetteer	xxxv—xxxvii
II. An account of Land Management, 1870-1952	xxxviii—xlii
III. An account of the district of Dinajpur in 1808-9 by Dr. Francis Buchanan Hamilton	xliii—xcii
A list of rural and urban tracts in the district of West Dinajpur	xciii—xciv

SERIES 1—POPULATION

General Population Tables

1.1 Area, Houses and Population	1
1.2 Variation in Population during fifty years	2
1.3 Towns classified by population with variations since 1901	2
1.4 Towns and villages classified by population	3—5
1.5 Persons per-occupied house, sex and livelihood class ratios	6
1.6 Approximate population of Unions	7—8

Livelihood Tables

1.7 Towns arranged territorially with population by livelihood classes	9
1.8 Summary of livelihood classes and variations in population	10—13
1.9 Economic Table I—Livelihood Classes and Subclasses (District and Tracts)	14—16
1.10 Economic Table II—Secondary Means of Livelihood (District and Tracts)	17—28
1.11 Economic Table III—Selfsupporting persons classified as Employers, Employees and Independent Workers in Industries and Services by Divisions and Subdivisions (District and Tracts)	29—43
1.12 Classifications by Livelihood Divisions, Subdivisions and Groups	44—50
1.13 Livelihood Classes classified by age groups	51—52
1.14 Livelihood Classes by Educational Standards	53—55

Age Tables

1.15 Age and Civil Condition for Sample and Displaced Population in rural and urban tracts	56—61
1.16 Age and Literacy for Sample and Displaced Population in rural and urban tracts	62—66
1.17 Single Year Age returns for Sample Population with rural and urban break-up	67—68

Social and Cultural Tables

1.18 Household—Size and Composition (District and Tracts)	69
1.19 Mother tongue (District and Tracts)	70—71
1.20 Bilingualism (District and Tracts)	72—75
1.21 Religion (District and Tracts)	76
1.22 Scheduled Castes and Scheduled Tribes (District and Tracts)	77
1.23 Non-Backward Classes and Classes which are neither Scheduled nor Non-Backward (District and Tracts)	77
1.24 Abstract of Anglo-Indians (District and Tracts)	77
1.25 Migrants	78—79

Displaced Persons and Nationality Tables

1.26 Displaced Persons by district of origin and date of arrival in India	80—87
1.27 Non-Indian Nationals (District and Tracts)	88

SERIES 2—VITAL STATISTICS

2.1 Birth and Death Record, 1941-50	89
2.2 Deaths from selected causes, 1941-50	89—91

SERIES 3—AGRICULTURE

3.1 Persons cultivating own land or employing bargadar with size of land owned and/or given in bhag	92—93
3.2A Mean density (persons per sq. mile), cultivating and cultivated areas, irrigation, rainfall and distribution of crops, 1949-50	94
3.2B Agricultural Statistics, 1949-50	94
3.3 Cultivated Area (excluding orchards and gardens), 1949-50	95
3.4 Progress of cultivation during three decades	95
3.5 Components of cultivated area during three decades	95
3.6 Length of Government embankments	95
3.7 Statement of Land Utilisation in the district in 1944-45	96
3.8 Abstract of culturable waste land blocks of 100 acres and above in 1944-45	97
3.9 Results of crop cutting experiments during the year 1944-45	97
3.10 Results obtained by a detailed economic enquiry made in selected villages during the month of October, 1945	98—99
3.11 Rainfall and Rainy days, 1941-50	100

SERIES 3—AGRICULTURE—concl'd.

3-12	Mean Maximum and Highest; Mean Minimum and Lowest temperatures in headquarters station (1948-50)	101
3-13	Frequency of Floods and Droughts	102
3-14	Production of food grains during three decades	103

SERIES 4—INDUSTRY

4-1	Census of Small Scale Industries—	
	(a) Classification of industries by locality	104
	(b) Textile establishments	104—105
	(c) Non-textile establishments	105
4-2	Growth of Factories, 1940-49	105
4-3	Factories classified by industry with average daily number of workers in each, 1949	106
4-4	Average daily number of workers employed in seasonal and perennial industries, 1940-49	106
4-5	Average daily number of workers employed in Jute Mills by class	107
4-6	Average daily number of workers employed in Cotton Spinning and Weaving Mills by class	108
4-7	Public Electric supply undertakings	109

SERIES 5—ADMINISTRATION

5-1	Land Revenue, 1941-50	110
5-2	Criminal Justice—Number of Criminal cases tried	110
5-3	Criminal Justice—Persons convicted or bound over	111
5-4	Civil Justice	111
5-5	Strength of Police, 1950	112
5-6	Jails	113
5-7	Number and description of registered documents and value of properties transferred, 1949	113
5-8	Co-operative Societies, 1949-50	113
5-9	Receipts of Excise Revenue	114
5-10	Receipts of Sales Tax	115
5-11	Receipts of Entertainment Tax	115
5-12	Receipts of Motor Spirit Tax	115
5-13	Stamps	116
5-14	Income Tax	116

SERIES 6—EDUCATION AND ENTERTAINMENT

6-1	Public Institutions and Pupils in 1950-51	117
6-2	Education (Number of Institutions and Pupils), 1941-50	117
6-3	Directory of High English Schools, 1951	118—120
6-4	Printing Presses and Newspapers	121
6-5	Cinemas	121

SERIES 7—PUBLIC HEALTH

7-1	Classified number of hospitals and dispensaries, 1950	121
7-2	Rural Health Centres	121
7-3	Hospitals and Dispensaries	122

SERIES 8—LOCAL BODIES

8-1	Receipts and expenditure of District Board, 1941-50	123
8-2	Receipts and expenditure of Municipalities, 1941-50	124

SERIES 9—COMMUNICATIONS

9-1	Village Roads	125
9-2	Roads and Bungalows	126
9-3	Length of roads maintained by public authorities on 31st December, 1948	127
9-4	Railway Stations	127
9-5	Post Offices	128
9-6	Polymetrical table of distances	129

SERIES 10—ANCIENT MONUMENTS AND FAIRS

10-1	Glossary of the better known ancient monuments	130—137
10-2	List of important Fairs and Melas	139

SERIES 11—VILLAGE DIRECTORY

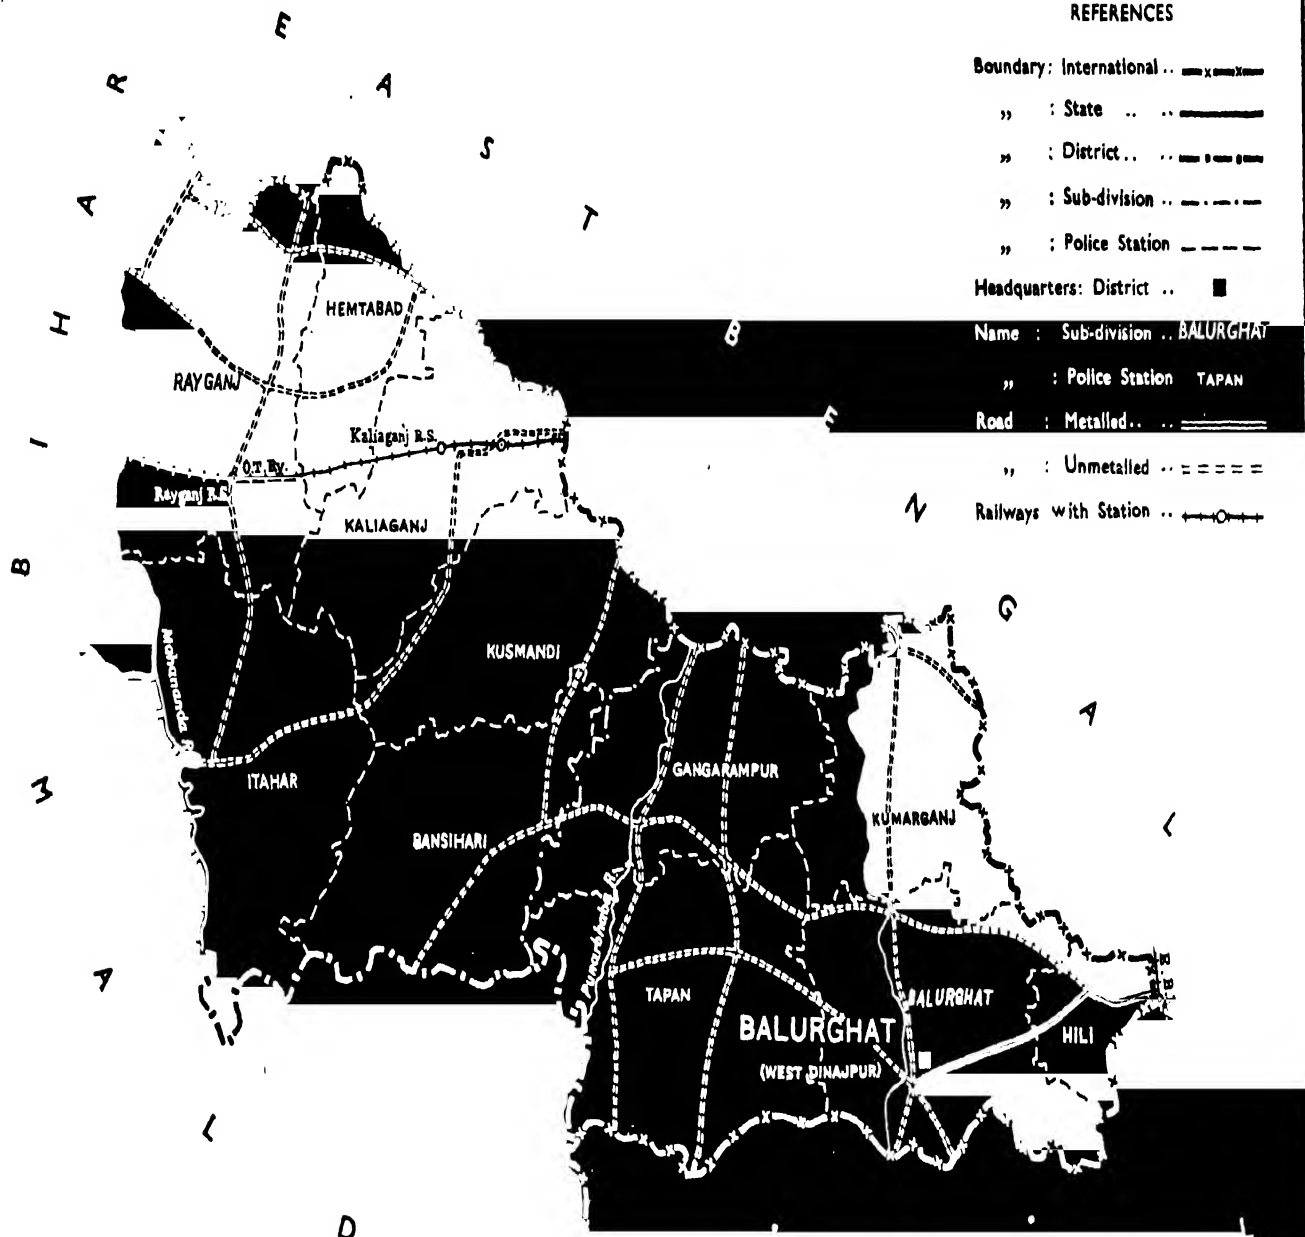

11	Village Directory	139—176

INTRODUCING THE DISTRICT

THE DISTRICT of West Dinajpur has two subdivisions: Sadar or Balurghat and Raiganj, with their headquarters at Balurghat and Raiganj respectively. The Sadar or Balurghat subdivision consists of the thanas of Hili, Balurghat, Kumarganj, Tapan and Gangarampur. The Raiganj subdivision covers the thanas of Bansihari, Kushmandi, Kaliaganj, Hemtabad, Raiganj and Itahar.

There is a total of 2,402 *mauzas* borne on the Jurisdiction List, of which 87 were returned as uninhabited in the census of 1951, 12 were included in the three towns of the district, and 2,303 rural *mauzas* are inhabited. The town of Balurghat is situated in Balurghat police station, that of Hili in Hili police station, that of Raiganj in the police station of its name. Hili has been declared a town in two censuses: 1941 and 1951; Raiganj and Balurghat were declared towns only in 1951. Both of the latter towns were constituted municipalities after the census of 1951. The most populous town is Balurghat with a population of 18,121, followed by Raiganj (15,473), and next by Hili (8,346). Throughout this book a village has been equated to a cadastrally surveyed *mauza*, bearing a Jurisdiction List number.

The district is a product of the Partition of Bengal in August 1947. Before 1947 it did not exist in its present shape, but formed only the southern portion of the Dinajpur district. In the old district of Dinajpur, Balurghat subdivision used to be much bigger. There used to be no subdivision called Raiganj, certain thanas of which were in the Sadar subdivision of Dinajpur. The following extract from the partition award of Sir Cyril Radcliffe outlines the boundary of this district:

A line shall then be drawn from the point where the boundary between the Thanas of Haripur and Raiganj in the District of Dinajpur meets the border of the Province of Bihar to the point where the boundary between the Districts of 24-Parganas and Khulna meets the Bay of Bengal. This line shall follow the course indicated in the following paragraphs.

The line shall run along the boundary between the following Thanas:

Haripur and Raiganj; Haripur and Hemtabad; Ranisankail and Hemtabad; Pirganj and Hemtabad; Pirganj and Kaliaganj; Bochaganj and Kaliaganj; Biral and Kaliaganj; Biral and Kushmundi; Biral and Gangarampur; Dinajpur and Gangarampur; Dinajpur and Kumarganj; Chiribhandar and Kumarganj; Phulbari and Kumarganj; Phulbari and Balurghat. It shall terminate at the point where the boundary between Phulbari and Balurghat meets the north-south line of the Bengal-Assam Railway in the eastern corner of the Thana of Balurghat. The line shall turn down the western edge of the railway lands belonging to that railway and follow that edge until it meets the boundary between the Thanas of Balurghat and Panchbibi.

From that point the line shall run along the boundary between the following Thanas:

Balurghat and Panchbibi; Balurghat and Joypurhat; Balurghat and Dhamarhat; Tapan and Patnitola; Tapan and Porsha.

After the Radcliffe award the Government of West Bengal issued several Notifications forming the district of West Dinajpur and its constituent subdivisions and police stations. A list of the notifications is reproduced below:—

Notification No. 1392P1, dated 17.2.43 transferring J.L. Nos. 185 and 187 to 211 of P.S. Kaliaganj to P.S. Raiganj.

Notification No. 1150P1, dated 8.5.48 regarding establishment of a new P.S. Hili comprising J.L. Nos. 277 to 278, 281 to 290, 293 to 357, parts of 358, 359 and 363, 364 to 389, 391 to 267.

Notification No. 548GA, dated 23.2.48 forming district of West Dinajpur after partition consisting of the following police stations:—

(1) Balurghat, (2) Kumarganj, (3) Gangarampur, (4) Tapan, (5) Raiganj, (6) Hemtabad, (7) Bansihari, (8) Kushmandi, (9) Kaliaganj and (10) Itahar.

Notification No. 1342GA, dated 8.5.48 regarding addition of P.S. Hili in the district of West Dinajpur as declared in Notification No. 1150P1, dated 8.5.48.

Notification No. 2139GA, dated 14.7.48 forming Raiganj subdivision comprising P.S. (1) Raiganj, (2) Hemtabad, (3) Bansihari, (4) Kushmandi, (5) Kaliaganj and (6) Itahar.

Notification No. 1029GA, dated 11.4.49. Declaration of Raiganj as the Headquarters of Raiganj subdivision.

The district, therefore, is a very new one and acquired an entirely new administrative structure in 1947. It has been placed under the Commissioner of the Presidency Division and the Deputy Inspector General of Police, Northern Range. The District and Sessions Judge whose headquarters is at Jalpaiguri is also in charge of Jalpaiguri, Darjeeling and Malda districts. There is an Additional District and Sessions Judge of Malda and West Dinajpur with headquarters at Malda, who is also a Judge of the West Dinajpur-Malda Special Court. There are a District Magistrate and Collector and a Senior Deputy Magistrate and Deputy Collector. The strength of the executive service recommended by the Divisional Commissioner for general administration is two officers of the West Bengal Civil Service for Sadar subdivision, of whom one is the Subdivisional Officer of Balurghat. In Raiganj subdivision an officer of the West Bengal Civil Service holds charge of the subdivision. In the Sadar subdivision there are six officers of the West Bengal Junior Civil Service, of whom one is a Magistrate of the First Class. In Raiganj subdivision there are five officers of the West Bengal Junior Civil Service. There is a Super-

intendent of Police for the district, aided by a Deputy Superintendent of Police at Balurghat and an Assistant Superintendent of Police at Raiganj. The Commissioner of the Presidency Division at Calcutta has a second headquarters at Jalpaiguri, and the Deputy Inspector General of Police of the Northern Range has his headquarters at Jalpaiguri. In the Sadar subdivision there are two Circles, each under a Circle Officer: the Circle Officer, Sadar, is in charge of the police stations of Hili, Balurghat and Kumarganj; the Circle Officer of Gangarampur with his headquarters at Gangarampur, is in charge of Tapan and Gangarampur police stations. Raiganj subdivision has also two Circles: the Circle Officer of Raiganj with his headquarters at Raiganj, is in charge of Raiganj, Hemtabad and Itahar police stations, while the Circle Officer of Kaliaganj with his headquarters at Kaliaganj is in charge of Kaliaganj, Bansihari and Kushmandi police stations.

PHYSICAL ASPECTS

A large tract of East Bengal and Bihar intervenes between the blocks of Sikkim, Darjeeling, Jalpaiguri and Cooch Behar in the north and West Dinajpur to the south, the portion of the old Dinajpur district which formed the link, in undivided Bengal having gone to East Bengal after 1947. West Dinajpur is a boot-shaped district with its toe dug into East Bengal.

The district lies between 25°10' and 25°50' north latitude, and 88°02' and 89°01' east longitude. The area of the district according to the Surveyor General of India is 1,385 square miles, but according to the Director of Land Records and Surveys of West Bengal, 1,385.5 square miles, its greatest length from the northwestern tip to the southwestern being 70 miles and its greatest breadth between north and the south being about 39 miles. Its population at the census of 1951 was 720,573 persons. The chief town is situated at the south-eastern corner of the district on the left bank of the Atrai river in 25°13' north latitude and 88°47' east longitude. According to Buchanan Hamilton, Dinajpur is said to signify the abode of poor men, from *din waz*. The district is bounded on the north and east by East Bengal; on the northwest and west by Purnea; on the southwest and south by Malda and East Bengal respectively. The Nagar river joins the Mahananda, forms the boundary of the district on the west.

General configuration—The general appearance of the country is flat, sloping gently southwards, as is shown by the trend of the rivers. In the southern portions of the west of the district the curious formation known as the *Barind*, geologically classed as old alluvium, makes its

appearance. The characteristic of this is an undulating country interspersed with ravines. The ravines are nowhere worthy of the name of hills, the highest range not exceeding 100', but they make, nevertheless, a considerable alteration in the appearance of the country, which elsewhere consists of the flat level plain characteristic of Gangetic delta. The ravines vary from stretches of low land suitable for growing rice, to deeper depressions bearing resemblance to old river beds and sometimes containing water. These latter are locally called *kharis*. The ridges are commonly covered with shrub jungles and stunted trees. In the north the country is broken up with patches of true jungle and clumps of bamboos; the cultivated areas are smaller in size, and the villages consist of scattered homesteads enbowered in luxuriant vegetation. In the south the country is more open; clumps of trees are comparatively scarce; the villages are often clustered as houses situated on bare ridges or on open river banks, and the prevailing tall bamboos and date palms give a peculiar character to the scenery reminiscent of the Santal Parganas and Birbhum.

River system—Another marked feature of the district is the tanks, especially numerous in the central portions of the district, where wells are comparatively little used. Of these tanks more details will presently be given; they vary in area from splendid stretches of water which might justly be called lakes or meres, to small insignificant ponds. The history of this tract of the country and the surroundings, which are now parts of East Bengal, confirm the evidence of these tanks that the tract was one of the most important and populous areas in Eastern India up to the mediæval period. A definite pattern in the situation of the tanks is easily discernible. Usually the biggest sheet of water is laid at some high point of the topography and smaller tanks are found all round the big tanks at lower levels, which seems to signify that a very efficient system of irrigation from tank water used to obtain in former times, remnants of which are still in evidence to the present day.

Old writers make mention of the large number of marshes or *bils*, a form of the overflowing of the rivers, to be found in the district. Owing to the deserting of its Atrai course by the Teesta in 1787-89, many of these marshes have disappeared, although in the rainy season some of them are still of considerable extent.

The general direction of the main rivers is without exception from north to south, and the ultimate destination of all is the Ganges. Other beds are, as a rule, well below the level of the country and it is only in exceptionally wet years that they overflow their banks to any great extent. In the rainy season the main rivers, such as the Nagar, Tangan, Punarbhaba and

Atrai, are navigable by good-sized country boats well into the district, but in the dry season, or for as much as eight months in the year, there are few points at which they are navigable at all, and most of them are fordable almost throughout their entire course through the district. There is good reason to suppose that the main rivers are gradually becoming shallow through silting up. The immediate cause of this is the sluggishness of the currents throughout the greater part of the area. The river channels are well-marked and fairly constant though there is evidence that in the past this was not always so and the changes of course occasionally took place into the main rivers from many smaller streams or *khals*. These are navigable by small boats in the rains, but throughout the greater part of the year they are either dry or dwindle to a string of pools. Generally speaking, the rivers and streams are of little use for purposes of communication between October and June.

Rennell's map (1779-81) shows the present Atrai and Punarbhaba as the Teesta and these streams used to carry the water which now flows down the Teesta. In Rennell's time (about 1777), the Teesta ran down from the Himalayas above Jalpaiguri flowing south commingled with the Karatoa and Atrai rivers and fell into the Ganges near Goalundo. South of the Ganges the old mouth of the Bhairab suggests that the Teesta shot through the Ganges and went down the Bhairab through Nadia. One branch, the Punarbhaba, joined the Mahananda near the latter's confluence with the Ganges. In 1787, not long before the diversion of the Brahmaputra, the Teesta, which in its upper reaches is a mere mountain torrent, made a complete evulsion during an unusual flow, and leaving Jalpaiguri to the west, flowed south-east in its present bare course into the Brahmaputra. Probably this was, as Fergusson suggested, along an old bed of the river since Rennell shows a "Teesta creek" passing south of Nilpur above the position of its present junction with Brahmaputra and a series of pools along its course. The mouth of the river has worked down the stream considerably since that time. Even the Revenue Surveyors called the upper Atrai above Khansama in East Bengal, the Teesta. By Buchanan Hamilton's time (1808) the present Jamuneswari and Karatoya had become the channel for much of the Teesta water.

The following is a brief account of the principal rivers proceeding from west to east. The Nagar takes its rise at a place north of Atwari, where the districts of undivided Dinajpur, Purnea and Jalpaiguri meet. It takes a south-easterly course and forms the boundary between Purnea and West Dinajpur districts throughout the west until it joins the Mahananda at village Jayhat (J.L. 233) in P.S. Itahar.

Its bed is rugged in the upper reaches but becomes sandy lower down. The lower portion of its channel is deeper than those of most of the other rivers in the district. Shortly before its junction with the Mahananda the Nagar throws out a side branch called the Sui river, which entering the district, follows a winding course, never far remote from the Mahananda, and finally joins the latter about 18 miles lower down. A small river called the Nona takes its rise in the *bil* area of Barodhara and Mahua in Raiganj P.S. and falls into the Nagar at *mauza* Paikpara (J.L. 68). The principal tributary of the Nagar is the Kulik, which rises in a marsh about 6 miles west of Thakurgaon in East Bengal and after running in a south-westerly direction along the border of Raiganj and Hemtabad police stations, traverses the middle of Raiganj P.S. and falls into the Nagar at Dishuwar (J.L. 133) at the south-western junction of Raiganj and Itahar police stations. About 8 miles upward of this junction it passes the important trading centre and subdivisional headquarters of Raiganj, the principal jute mart in the district. The Mahananda joins the Nagar river at Mukundapur near the trijunction of West Dinajpur, Purnea and Malda districts, and flowing south-west, forms the boundary between West Dinajpur and Malda upto *mauza* Tharis (J.L. 225) of P.S. Itahar, and then again forms the boundary of the two districts at Jayhat and Aminhat from which point it passes into Malda district. The Gomar, a small stream, comes down from Pirganj in East Bengal and flowing south-wards for about 3½ miles, falls into the Kulik at *mauza* Kastaray (J.L. 46) of Hemtabad P.S. The Chhiramati takes its rise in a marsh in the south-western portion of the Kaliaganj police station, and passing southwards at the trijunction point of P.S. Itahar, Kaliaganj and Kusmandi, first forms the common boundary between Itahar and Kusmandi, north to south for about four miles, flows in a south-westerly direction along the boundary of police stations Itahar and Bansihari and finally through P.S. Bansihari and Itahar into Malda district after a course of some 20 miles. It is a sluggish stream of little importance with no tributaries. The village of Patirajpur, the most important market near the boundary of Itahar and Kusmandi, is situated on its right bank. The Tangan enters the district on its northern boundary from the trijunction of Pirganj and Bochaganj of East Bengal with Kaliaganj police station, and after passing through the east of the thana of Kaliaganj, turns out through Kusmandi and Bansihari, and enters into Malda district, where it joins the Mahananda at Aiho. The channel of this river is rather narrow with steep banks and is sandy in its upper reaches. In the rains fair-sized country boats can come up as far as Radhikapur, in police station Kaliaganj, which

is situated on its left bank. Besides Radhikapur, the important market of Sihol and the large village of Bansihari are the two most important places situated on its banks. The former is the centre of a weekly market of some note, while the latter is noteworthy as being the site of the local police station and the junction of the important highways of Balurghat-Raiganj and Balurghat-Malda. The principal tributary of the Tungan is a small spring called the Balia-khari which taking its rise in the northern hill area of Kusmandi police station, runs through the middle of Kusmandi and Bansihari thanas and joins the Tungan in Malda. The Punarbhaba rises in the Thakurgaon subdivision of Dinajpur district in East Bengal and enters the district in the northern extremity of P.S. Gangarampur at *mauza* Mullickpur (J.L. 5). It runs south-west through the western portion of Gangarampur police station. It passes west of the village Gangarampur, the headquarters of the police station of its name. Two miles after entering the district the Punarbhaba sends out a distributory called the Kasiani Khal at Khajapur (J.L. 25) which meandering for about 7 miles again joins the Punarbhaba north of Kasimpur (J.L. 117). At Kasimpur, however, where it joins the Punarbhaba, the *khal* is anonymous, because Kasiani Khal itself joins the Barakharia Khal from the east at Samra (J.L. 123), about half a mile west of Pransagar and then takes a career almost due south across the eastern portion of Gangarampur and P.S. Tapan. About three miles north of Gangarampur the Punarbhaba sends out a branch in a south-westerly direction, called the Brahmani river, which after a course of 18 miles, rejoins the parent stream in Malda district. A few miles below Gangarampur the two channels are united by a canal. On nearing the boundary of Malda through the western portion of P.S. Tapan it forms a boundary between Malda and West Dinajpur for about 6 miles along the western border of Tapan police station and then runs due south through a stretch of lowlying country called the *Duba*, from its being subject to inundation in the rainy season, till it enters East Bengal in Porsa P.S. Its ultimate destination is the Mahananda. The Punarbhaba is navigable by country boats during the rains throughout the district of West Dinajpur. At other times of the year its upper reaches are shallow and easily fordable, but during its course through the *Duba* its channel narrows and deepens and is never fordable even in the height of the dry season. The more important places on its banks are Bangarh a mile above Gangarampur on the left bank, Narayanpur beside Bangarh on the right bank, Gangarampur the headquarters of the police station on the left bank, the important grain market of Kardaha in Tapan police station. A considerable export trade in paddy and rice used to be carried by this river before the par-

tition. The Atrai first touches the district at its northern extremity at Samjia (J.L. 20) in police station Kumarganj. It then runs along the boundary of Kumarganj and Dinajpur police stations for about four miles, after which it enters the district at *mauza* Kamdebpur (J.L. 9). It then takes a meandering but due southerly course past Kumarganj village, and enters Balurghat police station at the northern extremity of Par Patiram (J.L. 28). It continues its southerly course leaving Balurghat town on its left bank, and passes out of the district into Rajsahi of East Bengal at *mauza* Chak Bhatsala (J.L. 84), police station Balurghat. It is this Atrai which was at one time the main channel of the Teesta, but in 1787-88 the Teesta changed its course and made its way to the Brahmaputra through the Rangpur district, thereby greatly diminishing the volume of water passing through the Atrai and its sister channels, the Jumna and Karatoa. In June 1889 under orders of the Governor-General in Council an attempt was made to restore the Teesta to its original channel, which was abandoned as impracticable six months later. Since those days the importance of the Atrai has suffered still further from a tendency to silt up especially after the level of the river-bed was raised in the earthquake of 1897. Before the partition it was the most important river in the district and in the rains carried a considerable export trade in grain. But after the partition the traffic in the Atrai has been bottled up by the two ends falling in East Bengal. The channel is wide, shallow and sandy, and its stream sluggish. At the time of the Revenue Survey in 1863 it was described by Major Sherwill as constantly changing its course, but of recent years such changes have been slight. The principal villages on its banks are Samihia, Kumarganj, Patiram, and Balurghat, all of which are important grain marts, though with the bottling up of the river at its two extremities their importance has considerably diminished. The Ghuksi Khari, sometimes called the Ichhamati, is another stream flowing due south through the eastern half of Balurghat police station, keeping a distance of about six to eight miles parallel to Atrai river. The important villages along its course are Kamarpura and Bhabanipur. The Ghagra river enters the eastern half of Balurghat police station at *mauza* Bannahat (J.L. 276) and takes a southerly course through Balurghat thana and leaves the district at Pirojpur (J.L. 396). The river Jamuna enters the easternmost corner of the district at village Agra (J.L. 356) and keeping the town of Hili on its left bank, leaves the district at *mauza* Ujar (J.L. 364). The Jamuna flows only for about $3\frac{1}{2}$ miles in the district. The channel of this river though narrow has a fair depth, and is navigable for good-sized

country boats, one of the reasons which contributed to the importance of Hili.

The district has a general slope from north to south and the height of Hili above sea level is only 84'.

Geology—From the point of view of the geologist, the district of West Dinajpur is exceptionally uninteresting. Almost the whole area is covered by alluvial deposits of recent formation. The soil consists chiefly of a clayey silt, ash-coloured in appearance, locally called *khuyar*. This, a soft sticky loam in the rainy season, hardens almost to the consistency of cement in the dry weather, when it is unsuitable for vegetation. On the banks of some of the principal rivers, the soil consists of a sandy loam. This goes by the local name of *pali*. The older alluvial formation called the *Barind*, described in connexion with Malda, occurs in places in this district in common with other parts of North Bengal.

Soils—In the north-eastern portion of the district of West Dinajpur the soil is light ash-coloured sandy loam changing gradually as one proceeds south to a stiff clay of similar colour. The former goes by the name of *pali*, is very retentive of moisture and is capable of producing two crops; the latter is known as *Khuyar* and ordinarily bears but a single crop. In the southern or *Khuyar* area isolated patches of the lighter soil are to be found here and there, especially on both sides of some of the larger rivers like the Atrai. This indicates that this sandy loam had its origin in the sand and silt deposited by the rivers when they overflowed their banks. This is hardly true *pali*, but is rather soil in a transition stage with a larger proportion of sand in its composition than the older *pali*. *Chora* or *balia*, as it is sometimes called, is perhaps a better name for it. Nowadays the beds of most of the rivers are deep and wide and the deposit of sand or silt by floods is no longer a factor to be reckoned with seriously over the greater part of the district. In the extreme south of the district the *Barind* makes its appearance. The higher ground in this tract is generally barren and little attempt is made to cultivate it. The low ground is a stiff clay of reddish colour and is excellent winter rice land, though, like the *Khuyar* area, it does not lend itself to the cultivation of any other crop.

Forests—Forests properly so called are almost entirely absent, with the exception of one or two patches of tree jungle on the banks of the Tangan river. These patches are the survivals of a once extensive tract of forest which probably descended from the Terai. Coppices of *sal* are fairly common throughout the district. Common as it is, the *sal* tree never attains a good growth in this district. It is

stunted, gnarled, and of small girth. A reason for its stunted size may be the common practice of burning the undergrowth in these coppices in the beginning of the hot season to provide grazing for the village cattle. The timber is used in building, but is by no means first class. Forests in West Dinajpur swiftly came under the axe in the present century, owing to a very rapid extension of cultivation. In 1951 West Dinajpur could boast of only two square miles of forest owned by private individuals.

In 1951 the Forest Department of the State took up small patches for afforestation: 40 acres of *bil* area in Bahurghat police station, 50 acres of *danga* area on the high land in Kumarganj police station and 25 acres of high land in Hemtabad police station. The Department tended several nurseries at Bahurghat, Kumarganj and Hemtabad. In Khaspur locality of Bahurghat police station the Forest Department took up 174 acres of waste land for afforestation in three *mauzas*: Madanganj, Parbatipur and Dafanagar. In Kumarganj police station it took up another area of 69 acres at *mauza* Chak-Gangaprasad. The Department managed to persuade private owners to vest 56 acres of waste land to the management of the Forest Directorate and 49 acres of private forests to the management of the Forest Directorate. The Forest Directorate also controlled in 1952, under their approved working plans about 427 acres of forest land in West Dinajpur. The total area of vested lands that were afforested up to 1952 was 292 acres. In the *bil* area the *jarul* (*lagerstroemia reginea*) was tried but discarded in favour of *hijal* (*barringtonia acutangula*) which was found to be a natural inhabitant of this particular area. In the year 1951 *hijal* was extensively planted and the results were satisfactory. In the high lands teak (*tectonia grandis*), *sishu* (*dalbergia sisso*), *gamari* (*gmelina arborea*) have been planted as timber, and *simul* (*salmoli malabaricum*) has matured. The following species are being planted as fuel: *Minjri* (*caasia siamea*), *siris* (*albizzea*), *arjun* (*stermenalia arjuna*), *jam* (*eugenia gambolana*), *nem* (*azadarachta indica*). *Minjri* has taken kindly to the district and is a fast growing species. In sandy areas *babul* (*acacia arabica*), *wattle* (*acacia moniliformis*) and *casuarina* are being tried out.

Flora—Notwithstanding the want of true forest, the district is by no means deficient in vegetation. The roads are bordered with trees of all sizes and varieties, amongst which the most conspicuous are the banyan (*Ficus indica*), the peepul (*Ficus religiosa*), the *pakar* (*Ficus infectoria*), the *simul* or cotton tree (*Bombar malabaricum*), the *nim* (*Melia indica*), the *amarind* (*Tamarindus indica*), the mango, the jack (*Artocarpus integrifolia*), the *babul* (*Acacia arabica*), the Indian plum or ber (*Zizyphus*

jujuba), the champak (*Michelia champaca*), and the hijal (*Barringtonia acutangula*). The villages are embowered in greenery, clumps of wild bamboo are to be seen on all sides, and the banks of the rivers and old tanks are overgrown with thickets of shrubs and bramble. The southern portion of the district is more open, and palms such as the palmyra or *tāl*, and the date-palm or *khejur*, are much in evidence, and give a distinctive note to the scenery. In parts of the district especially in the neighbourhood of some of the large *bils*, stretches of grass jungle are found. The most extensive of these is the tract of country called the *Dubā* extending along the Punarbhaba river from the extreme south western corner of the district well into Gangurampur thana. Here are to be found many species of grasses and reeds, such as the *ikra* (*Sachharum arundinaceum*) which when set upright and plastered with mud makes an excellent house wall; the *nagormuthā*, a species of tall grass with a triangular blade or stem, used for making sleeping mats and elephant *gadis*; the *khaskhas* (*Andropogon muricatus*), a plant with an odorous root, used in many parts of India for making screens, which, when moistened, forms a pleasant protection against the west winds of the hot weather; the sun grass, called in the vernacular *san*, which is the best material for thatching. *Tamarix* and *Rosa involucrata* are also common, the latter bearing a great resemblance to the English wild-rose. In this district the ubiquitous bamboo usurps to some extent the place of reeds, for building, fencing, making fish traps, and other purposes. The *nal* (*Phragmites roxburghii*), a species of tall reed with a feathery top, and the *sola* (*Aschynomene paludosa*), a plant from whose root a fine white pith, greatly used for making sunhelmets, floats for fishing nets, etc., is obtained, are common in many of the old tanks. The former is a marked feature of the fine old tank called Mahipal dihi, forming as it does a thick belt all round it. The finest trees in the district are undoubtedly the figs. Many magnificent examples of the banyan and peenul are to be seen, and they afford a grateful protection from the sun in the hot weather. Perhaps the finest specimen of the former is to be found at Hemtabad, a favourite camping ground for touring officers, and several tents can be pitched with ease beneath its shade. The *simul* or cotton tree is common, and attains a fine growth, and in the months of January and February, when ablaze with large crimson blossoms, presents a splendid appearance, in striking contrast to the blue of the sky. The tamarind, a handsome tree with spreading acacia-like foliage of a beautiful shade of green, is also frequently met with.

An account of the flora of West Dinajpur would be incomplete without some description

of the bamboo, so common in the district and utilised for so many purposes. Of these the *bara bāns* is the largest, most valuable, and most generally cultivated. It is used for posts, rafters, beams and sometimes for firewood. Another valuable bamboo is the *jāti bāns*, also greatly used in building for making battens, cross-pieces, etc. The *mākla bāns* is chiefly employed in making mats and baskets but is also used for making ceilings and is said to be more immune to the attacks of white-ants than any other kind. The *kántā bāns* or thorny bamboo generally grows wild, though it is also sometimes grown near tombs and monuments for ornament, on account of its beautiful feathery tops. It is very strong and is utilised in making fences and spear shafts.

Two species of cane, a thick and thin variety, probably *Calamus latifolius* and *Calamus gracilis*, are found in the district in woods, and in thickets near villages where the soil is sufficiently rich and moist. The thin variety is employed for baskets and wicker work. The thick variety is not much used.

Flowers, as distinct from tree blossoms and certain flowering creepers of the convolvulus family, are not common in the district, and do not deserve any special mention.

Fauna—With the exception of leopards, the larger mammalia are becoming very scarce in the district. Major Sherwill in his Revenue Survey Report, concluded in 1863, speaks of tiger, buffalo, *bārah singhā* or swamp deer, hog deer and badger, as common. Leopards are still fairly common in most parts of the district, but tigers are extinct. In 1951 the District Magistrate reported a leopard killed at Samjia in police station Kumarganj, quite a big one, which measured 7' 9". Generally leopards are found in the neighbourhood of villages and have their lairs in the thickets surrounding old tanks, and in old graveyards. The ruined remains of temples, mosques, and dwelling houses, so often found overgrown with jungle in the vicinity of towns and villages, are favourite haunts of these animals. Wild pigs are nowadays rare except in Hemtabad and parts of Raiganj where they do a certain amount of damage to the crops. Various kinds of wild cats, such as the ordinary wild cat, the tiger cat, the civet cat, and the fishing cat are common enough. The last named, locally called *māch birāl*, a large sized spotted animal with a short tail, is found in marsh-land and thickets bordering rivers, swamps and old tanks and feeds principally on fish and wild fowl. The various members of the cat tribe are very destructive of small game and will occasionally devour calves and kids. Jackal, fox and mon-goose are common. The crab-eating variety of of the latter is sometimes seen, and is probably identical with the badger spoken of by Major

Sherwill, as it bears some resemblances to that animal. Hyæna are mentioned as indigenous to the district; in May 1909 an unmistakable hyæna was seen in the Bansihari thana. Hares are found in the grass lands but are not numerous. The shorter tailed Bengal monkey (*Macacus rhesus*) is very occasionally seen. Old writers like Dr. Buchanan Hamilton and Major Sherwill make no mention of the *mithun* or bison (*Bos gaurus*) as being found in the district, but in 1907 a young full grown bison bull was shot by a villager near Raiganj in the extreme north of the old district of Dinajpur, after it had attacked and killed a man. This was probably a solitary animal which had made its way into Dinajpur from the Jalpaiguri Terai through the strip of forest on the upper banks of the Tungan. The Gangetic dolphin or *susu* (*Platanista gangetica*) is to be seen in some of the larger rivers.

Birds—The birds of the district include vultures of different kinds, kites—amongst which the Brahmani kite (*Haliastur indus*), a handsome bird with maroon back and white head and neck, is conspicuous—eagles, hawks, swallows and martins, *moinas* and king-crows. Owls are of many varieties, amongst which the small screech-owl is the prettiest and most common. The common Indian crow and the large black carrion crow are plentiful. Amongst birds of the cuckoo family the brain-fever bird (*Hierococcyx varius*)—the monotonous repetition of whose call note adds to the trials of the hot season,—and the coucal or crow pheasant (*Centropus sinensis*) are found. Small birds of handsome plumage or otherwise attractive appearance are the hoopoe, the golden oriole, the blue jay (*Coriapus indica*), the bee-eaters with their long, slender bills, and green plumage, king-fishers large and small. The plumage of the latter is generally a blending of metallic and turquoise blue, of indescribable brilliance, but the most common species of all is the Indian pied king-fisher (*Ceryle varia*), a black and white bird who is to be seen industriously plying his trade over every piece of water. The night jar or goat sucker (*Caprimulgus*) is found everywhere, and its peculiar note resembling a stone striking ice, which can be heard at a great distance at night, has earned it the name of the ice bird amongst Europeans. Of the columbae, the green pigeon, the common wood pigeon, and various kinds of doves are fairly plentiful. The green pigeon shows a special fondness for trees of the fig family, to the fruit of which it is very partial. An extremely beautiful and rather uncommon species of dove is worthy of special mention. This is a wood dove with beautiful dark green, crimson and copper plumage, and is one of the prettiest birds in the district. Amongst water birds may be mentioned the common coot

(*Fulica atra*), the purple moor-hen (*Porphyrio poliocephalus*), the common moor-hen, the dabchick, several kinds of herons and cranes, and two species of cormorant, one a small black species and the other a larger bird with black body and wings and yellowish head and neck. Sand pipers or snippets of various kinds and the Indian river tern are common to every stream and *bil*. Birds of the plover family found in the district are the grey plover, the little ringed plover, and the red-wattled plover (*Sarcogrammus*), the latter distinguished by its peculiar cry, which sounds something like “did you do it” or “pity to do it”. Snipes are not very common, but a few of the ordinary kinds, *i.e.*, fantail, pintail, jack and painted snipe may be met with on the edges of some of the larger *bils*. The land game birds of the district are the black partridge or *titr* (*Francolinus vulgaris*), the *kyah* or swamp partridge (*Ortygiornis gularis*), the grey quail and the button quail. The latter are to be found anywhere in grass jungle, but are never plentiful. Partridges of both kinds are fairly plentiful in the low grass country on the lower reaches of the Punarbhaba, but elsewhere are rare. The commonest wild fowl are the gadwall, the pochard, the common teal, the large and small whistling teal, and the cotton teal. These frequent some of the *bils* and rivers, and occasionally tanks also. The ruddy sheldrake or Brahmani duck is met with sometimes, but the larger and finer species of duck such as the mallard, the pintail, and the spotbill, are rarely, if ever, seen.

Reptiles—Snakes are fairly common, and the poisonous varieties are the cause of some loss of life, especially during the rains. The number of species is not large, the principal being the cobra, the *dhaman* (*Zamenis mucosus*) or rat snake, the common *karait*, various grass snakes, and some water snakes. The *hamadryas* or king cobra (*Naia bungarus*), the banded *karait* (*Bungarus fasciatus*) and the python or boa constrictor (*Python molurus*) are occasionally found. The former two varieties grow to a length of 7 or 8 feet, and both prey upon other snakes. The python rarely exceeds 12 feet, though individuals may attain 20 feet. Of the lizards the most familiar are the geckos, amongst which we may distinguish especially the small house gecko to be seen on the walls and ceilings of every house, and the large gecko (*Gecko stentor*) whose peculiar cry has given the name to the whole genus. This is most commonly found in the north-western portions of the district. On the edges of many of the *bils* the monitor or *guisāmp* is found. This is a large lizard, with some outward resemblance to a crocodile, and is eaten by some low caste Hindus. Two kinds of crocodiles, the *magar* (*Crocodylus palustris*) called locally *kumir* or *bochā*, a blunt-nosed species, and the *ghariyāl*

(*gavians*) or longsnouted, fish-eating crocodile, are found in some of the rivers, especially the Nagar, Punarbhaba, and Mahananda, and in some *bils* and old tanks. The *magar* rarely exceeds 12 feet in length, 10 feet being a fine specimen, while the *ghariyāl* rarely attains more than 7 or 8 feet. The former has the reputation of being a man-eater, but in this district instances of deaths from this cause are rare, if not entirely unknown, and the villagers appear to have little fear of them. The common river turtle (*Testudo elegans*) is found in most of the rivers, and is eaten by some of the lower orders.

Fish—Dinajpur was at one time famous for its fish and was known in the Mahabharata as Matsya Desha, or the fish country. This is no longer the case, and the principal fish supply is that obtained in its rivers and tanks. Some is also brought from Purnea. During the rainy season, when the rivers are swollen, the local fish-supply is especially scanty, owing to the inadequacy of the methods of the fishermen in coping with deep and rapid waters.

The most common fish in the district is probably the carp, of which the best known species are the *rohu* (*Labeo rohita*) and the *kātlā* (*Catla buehanani*). Both of these are commonly reared in tanks and sometimes attain a large size. They are a favourite table fish, and are a popular and acceptable gift amongst the higher classes. There are also found the following: the *boāl*, a fresh water shark (*Wallago attu*), popularly supposed in the historic tank of Tapandighi to attain the incredible length of 20 feet; the *māgur*, a cat fish, which is much esteemed as diet for invalids and convalescents, notwithstanding its repulsive appearance; the *paftā* (*Callichrus pabda*), a small but palatable table fish; the *shol* (*Ophiocephalus striatus*), a snake-headed fish, whose fry are not only well flavoured but of a pretty gold colour and are sometimes kept for their beauty in glass bowls; other snake-headed fishes such as the *gajāl*, *gorai* and *cheng*; the *kai* (*Anabas scandens*) or the climbing perch, which is distinguished by its ability to get from one piece of water to another (*incidentally* there is a legend that it has been known to climb trees); the *khokṣā* (*Trichogaster fasciatus*); the *bhedā* (*Ornandus marmoratus*); the *bain* (*Mastercembelus armatus*), an eel-shaped fish found in tanks, muddy rivers and sluggish streams; the *tepā* (*Tetradon patoka*) which Buchanan Hamilton describes as “a bad small fish reckoned impure by the Brahmins.” Among crustacea we have prawns of several kinds, locally called ‘chingri’, and *kāṅkrā* or crabs of the fresh water variety, which are eaten by the poorer classes.

The following is a list of fish commonly found in West Dinajpur district, kindly supplied by the Director of Fisheries, West Bengal.

	Local name	Scientific name
1	Roi	Labeo rohita
2	Catla	Catla catla
3	Mrigal	Cirrhhina mrigala
4	Kalbose	Labeo calbasu
5	Belia	Glossogobius giuris
6	Tengra	Mystus gulio
7	Puti	Barbus Sp.
8	Chital	Notopterus chitala
9	Hilsa	Hilsa ilisha
10	Chela	Chela Sp.
11	Bagda Chingri	Penaeus casikatus
12	Ghusa Chingri	Caridina Gracilipse & caridina propingus
13	Chapra	Penaeus Indicus
14	Ghusa	Casidesia Gracilipse and propingua
15	Air	Mystus aor
16	Ritha	Rita rita
17	Papda	Callichrous pabda
18	Koi	Anabas testudinous
19	Singhi	Heteropneustes fossilis
20	Magur	Clarius batrachus
21	Falui	Notopterus notopterus

Climate—The district of West Dinajpur lies just outside the tropics and its climate approximates more to that of Bihar than to that of the more central districts of the State. The cold weather may be said to set in early in November and to continue until the end of February. Although in a normal year the days begin to be hot from the end of February, the nights remain cool till well into April. The hot weather begins with strong westerly winds about the 1st of March and continues till the middle of June. The West is the prevailing wind till about mid-April when the nor'westers sets in sometimes with great fury. The nor'westers continue till the middle of May, interrupted by days of calm and light easterly breezes. In the hot season the air is extremely dry and far from enervating. February to May is perhaps the healthiest season of the year. With the setting in of the monsoon, which generally occurs about the middle of June, the rainy season commences and continues till the end of September or the beginning of October. The heaviest rain usually falls in July and August, sometimes even as early as June, and periods of flood, when the rivers rise and overtop their banks, may be looked for twice in the season. With the setting in of the monsoon the climate changes and becomes damp and unhealthy. The heat is tempered by easterly winds which spring up towards sunset and lower the temperature during the early part of the night. As the rainy season advances these winds disappear and the time from the middle of September to the middle of October can be exhausting and depressing. From the middle of October the nights become appreciably cooler though the days remain hot

for some time longer. The cold weather in West Dinajpur is one of the most agreeable climates in the State. The days are bright and sunny and the air crisp and clear. The cold is never extreme although in the beginning of January it can be quite cold. Little rain falls during the cold weather with the exception of some light showers towards the end of December and a thunder-shower or two in February. In December easterly and northerly winds are common.

Temperature—The average maximum temperature is lowest in January and highest in April. There is a diurnal variation in the months of March to May. The average minimum temperature varies from 49.4° in January to 79° in July, giving a variation of about 29.5°. The absolute maximum temperature varies between 82-83° in December to as much as 108° or 109° in May; the absolute minimum temperature from as low as 45° in February to 73° in July. The humidity of the atmosphere is lowest in March after which it steadily increases. It increases rapidly with the onset of the monsoon and is the highest in August and September. In October there is a slight fall, and from then

to the end of January there is little change. From the commencement of February the decrease in the humidity is rapid, till the lowest grade of saturation is reached in March.

Rainfall—There is very considerable variation in the rainfall in different parts of the district.

The following table of monthly and annual rainfall is given for Gangarampur, Itahar, Raiganj and Balurghat, from the Settlement Report of the district for the year 1933.

	Monthly and annual rainfall			
	Gangarampur	Itahar	Raiganj	Balurghat
January	0.25	0.35	0.35	0.36
February	0.73	0.63	0.57	0.70
March	0.70	0.61	0.77	0.78
April	1.65	1.37	1.41	1.64
May	6.03	4.59	5.59	6.73
June	12.91	11.56	12.77	11.98
July	15.60	13.87	14.75	13.18
August	14.05	13.02	14.18	12.36
September	11.02	11.57	10.82	10.51
October	4.18	3.22	3.40	4.45
November	0.13	0.26	0.19	0.32
December	0.15	0.09	0.11	0.08
Annual	67.40	61.14	64.91	63.09

The following Statement gives the monthly and annual rainfalls at Balurghat between 1942 and 1949

	1942	1943	1944	1945	1946	1947	1948	1949
January	..	1.84	1.71
February	1.50	0.60	0.15	0.86	0.06	..	1.98	2.03
March	0.27	..	0.74	0.09	0.69	0.52	..	0.27
April	3.89	4.05	2.92	1.70	5.13	1.28	2.76	5.38
May	3.43	5.47	4.70	4.71	5.54	5.36	5.97	14.92
June	6.06	25.84	11.45	16.59	13.82	9.66	15.70	25.88
July	10.10	17.44	33.63	10.50	14.70	22.00	25.30	16.42

HISTORY

The early history of West Dinajpur and its surrounding areas has been very ably described in the history of Bengal edited by Dr. R. C. Mazumdar and Sir Jadunath Sarkar, published by the University of Dacca in two volumes in the last decade. It is unnecessary to make a brief summary of the history of the district. The extracts from Dr. Buchanan Hamilton published as an appendix in this volume will also give interesting details. The district is very rich in archaeological remains, but very little

work has been done in this respect so far. The excavation of Bangarh undertaken by the University of Calcutta in 1937-8 stopped rather abruptly. The area around Tapan is likely to yield excellent results from excavation, as also the area around Hemtabad and Ekdala Bahirhata in the north-western corner of Bansihari police station.

THE PEOPLE

The following statement shows the growth of population in West Dinajpur district between 1872-1951 :

Population of administrative division of West Dinajpur with variation, 1872-1951

District and Police Station	Population 1951	Variation 1941-51	Population 1941	Variation 1931-41	Population 1931	Variation 1921-31	Population 1921	Variation 1911-21

The district registered an increase of only 21.9 per cent. on its 1872 population in fifty years, 1872-1921. It made far more rapid progress between 1921 and 1951: a percentage growth in 30 years of 46.9 on the 1921 population. As with all other districts the growth of this 30-year period expressed as a percentage of the 1921 population is slightly misleading as the influenza epidemic and other calamities of 1911-21 lowered the 1921 population a little more than what might be normally expected. Nevertheless the growth between 1901 and 1951 was quite satisfactory being 57.8 per cent. on the 1901 population. The district suffered from depletion only in one decade: 1911-21; but in 1872-81 it suffered badly from the effects of the Burdwan Fever, and in 1911-21 from the influenza epidemic. Other decades have been comparatively congenial to growth. Only two police stations, both jungly and feverish and formerly seats of royal power, suffered from depopulation during 1872-1921 and these were Hemtabad and Raiganj. Between 1921 and 1951 progress was heavy in all police stations of the Sadar subdivision and in Raiganj of Raiganj subdivision. This has been mainly due to an influx of 115,510 Displaced persons from East Bengal between 1947 and 1951.

The district has been unhealthy for the greater part of last century and in 1878 a Committee was appointed to inquire into the causes. But nothing very much came of it. The census of 1881 showed a gain of barely 1.3 per cent. which was more than accounted for by the greater accuracy of the enumeration. The district continued to be unhealthy for some years longer, but it then took a turn for the better, and in 1891 there was an increase of 4 per cent. of which, however, a considerable part was due to immigration. Between 1891 and 1901 the health of the district continued to improve but

was still far from satisfactory. Malarial fevers were still very prevalent. The crops were good on the whole. There were partial failures in 1891 and 1897, and the scarcity in the latter year was aggravated by the high prices which prevailed throughout India. The good harvests of subsequent seasons restored the prosperity of the cultivators but they were wanting in industry. The Raiganj-Dinajpur line was opened in 1888 and the Raiganj-Katihar line in 1889. During 1901-11 conditions were generally favourable. There was some scarcity during 1908 and 1909 in Raiganj. All distress disappeared with the bumper crops next year, and it does not seem to have affected the growth of population. During 1911-21 the district suffered heavily from the influenza epidemic. The population contains a large proportion of tribes and these as elsewhere seem to have suffered more severely than other races. During 1921-31 the immigration of Santals, Shershabadia Muslims and other colonists account for the increase in Kumarganj, Gangarampur, Bansihari, Kaliaganj, Hemtabad and Itahar. General health also improved. During 1931-41 Hili gained importance as a centre of rice and paddy while other areas steadily gained in population. During 1941-51 the district suffered both from the famine of 1943 and epidemics of 1944. It acquired its present size and importance in the Partition of 1947. Between 1947 and 1951 there was some emigration of Muslims to East Bengal. According to West Bengal Government the number of emigrating Muslims amounted to 14,000 of whom 12,375 later returned. The influx of Displaced persons from East Bengal amounted to 115,510, quite the largest for any district barring 24-Parganas, Calcutta and Nadia.

Percentage of age groups and of married women (15-40) to total population and of children (0-5) to married women (15-40) in West Dinajpur, 1901-51

Year	Percentage of persons, males and females to total population						Percentage of married women (15-40) to total population	Percentage of children (0-5) to total married women (15-40)
	Age group 0-15			Age group 15-40				
	P	M	F	P	M	F		
1	2	3	4	5	6	7	8	9
1901 . .	41.7	41.3	42.3	54.6	55.0	54.0	16.9	86.9
1911 . .	42.6	41.7	43.7	54.1	54.8	53.1	16.2	93.9
1921 . .	41.4	40.4	42.3	55.4	56.1	54.8	17.2	79.7
1931 . .	42.0	41.1	43.0	55.5	56.1	54.9	17.6	91.6
1941 . .	39.1	38.1	40.2	57.7	58.4	56.9	17.9	77.2
1951 . .	40.7	39.5	42.1	56.8	57.7	55.7	17.2	98.1

The statement shows the extent to which West Dinajpur has a young population and a comparatively small adult population of working age. It also illustrates how large specific mortality is among adult women. In every decade specific mortality among females has been higher than among males. The proportion of married women to total population is slightly high compared to other districts. The birth and death rates are obviously high. The size of the unitary family oscillates between

wide limits. In 1921 the influenza epidemic was particularly harsh on mothers aged 15-40. There seems to have been a considerable number of bogus inflations in the 1941 count among married women. The figure in column 9 for 1951 is higher than previous year possibly on account of the preponderance of young children among the immigrant Displaced population and the number of families left behind by Muslims who have emigrated to East Bengal in search of a living.

Immigration and Emigration in West Dinajpur from and outside the State, 1891-1951

	1951	1941	1931	1921	1911	1901	1891
Actual population . . .	720,573	583,484	523,977	490,434	509,557	456,501	423,305
Immigration . . .	153,251	25,539	22,783	32,310	43,292	28,736	15,058
Emigration . . .	4,119	2,459	2,062	2,000	2,000	114	4,102
Natural population . . .	571,441	560,404	503,256	460,124	468,265	427,879	412,349
Percentage variation . . .	+2.0	+11.4	+9.4	-1.7	+9.4	+3.8	..

The figure for immigrants of 1951 includes a Displaced population of 115,510. Without this figure, the number of immigrants from the States of India and outside amounts to 37,741. The excess from the normal of the previous three decades is explained by the new importance the area has acquired as a border district, and the immigration of labourers engaged in road build-

ing and other construction works. Emigrants have remained at more or less a constant level. The figure for 1951 does not include persons who have migrated to East Bengal. The statement shows that the progress of the natural population has been uncertain and far from steady.

Migration between West Dinajpur and other districts of Bengal in 1891-1921 and West Bengal in 1951

Year	Immigration				Emigration			
	From contiguous districts		From other districts		To contiguous districts		To other districts	
	M	F	M	F	M	F	M	F
1891 . . .	22,670	18,819	9,308	5,894	10,052	9,931	1,271	1,130
1901 . . .	13,901	13,319	60,243	34,871	6,784	7,799	1,416	802
1911 . . .	19,000	16,000	12,000	6,000	7,000	9,000	1,000	1,000
1921 . . .	12,000	13,000	10,000	7,000	8,000	10,000	1,000	1,000
1951 . . .	3,999	6,383	1,512	2,245	3,540	1,097	3,560	2,982

Figures for 1891-1921 in this statement have not been adjusted for the present jurisdiction of the district. But they indicate the volume of immigration in the early years of colonisers like Santals, Mundas, Oraons, Paliyas and Rajban-shis and Shershahadia Muslims in the great sparsely populated paddy tracts. They indicate

how colonisers moved into the district with practically their entire families. Those who emigrated also moved *en bloc* being perhaps sons and daughters of immigrants of an earlier generation or of the immigrants themselves. 1951 however suggests a different pattern of migration. The district seems to have contrac-

ted marriages in other districts to a greater extent than previously and imported brides, while more men seem to emigrate to other districts in search of livelihood.

As already noted, the district contains three small towns which have acquired importance since the Partition of 1947. The following statement shows the distribution of the population of the three population classes, (a) less than 2,000 per village, (b) 2,000 to 10,000 population per village, and (c) above 10,000 population per village or town.

		1951	1921	1901
Less than 2,000	Percentage of number of villages and towns	99.52	99.30	99.75
	Percentage of total population	91.23	91.91	95.98
	Percentage of number of villages and towns	0.39	0.68	0.24
2,000 to 10,000	Percentage of total population	4.11	7.03	3.16
	Percentage of number of villages and towns	0.09	0.02	0.01
	Percentage of total population	4.66	1.06	0.86

It will be seen from the above statement that the vast majority of villages in West Dinajpur is still in the population class of less than 2,000 persons per village. The district is thus very rural in character. Out of a total population of 720,573 as many as 678,633 live in rural areas. The percentage of rural population to total population is 94.18. The number of persons per occupied house in the rural areas is 4.77, and 5.41 in the towns. The number of females per 1,000 males in the district as a whole, is 877, for the rural areas 884, and for the urban areas 771.

Displaced population—A brief account must here be given of the Displaced population in West Dinajpur. In the census of 1951 as many as 115,510 persons declared themselves as having come from East Bengal on account of the Partition of the province. Of these 61,197 were males and 54,313 were females. Only two persons declared having migrated from West Pakistan. The influx of Displaced persons from East Pakistan year by year from 1946 to 1951 is set out in the statement below:—

Year	Males	Females
1946	162	60
1947	3,816	3,410
1948	6,271	8,253
1949	5,701	7,459
1950	42,585	33,074
1951	1,096	1,019

The vast majority of Displaced persons came into the district in 1950. While the rush in that year was very great, amounting to about 76,000 people, and created a big problem for

the newly set up administration of the State, it is possible to argue on the other hand that the district was fortunate not to have been confronted with this influx in the early months following Partition in 1947.

A circumstance which facilitated the rehabilitation of refugees was the mutual transfer of lands and homestead between many emigrating Muslim families and immigrating Displaced persons from East Bengal. Another circumstance was the availability of fallow or culturable land which the Displaced population gladly snapped up on arrival by private negotiation. As a result in 1949-50 only 8 Displaced families had to be settled in trade with trade loans, and 36 families settled in small-scale industries with loans and materials. In this year (1949-50) the Government had to spend only Rs. 19,552 by way of *ad hoc* cash doles. A sum of Rs. 28,300 was distributed as house-building loans to Displaced families. In 1950-51, 349 families were settled through Government effort with agricultural land and 20 more families in trade with trade loans, and 80 families in small-scale industries with loans and materials. The Government spent Rs. 1,484,000 in *ad hoc* cash doles during this year, Rs. 83,750 in house-building loans in rural areas only, Rs. 4,573 in purchasing building sites for refugees, Rs. 1,927 in reclaiming lands for them, Rs. 78,400 towards the purchase of bullocks, seeds, and agricultural implements to the agricultural classes, Rs. 1,167,925 on house-building loans to other categories of refugees and Rs. 83,925 in issuing small trade and business loans. The Government also spent Rs. 14,600 as loans to Displaced medical practitioners, and Rs. 1,000 as loan to Displaced lawyers. In 1951-52 the district administration had 550 families in refugee transit camps. The administration settled 709 families on agricultural lands, 37 families in trade with trade loans, 50 families in small-scale industries with loans and materials. It spent comparatively small sum, Rs. 6,471, on *ad hoc* cash doles, but as much as Rs. 294,075 on house-building loans in rural areas, Rs. 7,300 on purchasing building sites for refugees, Rs. 286,024 towards the purchase of bullocks, seeds and implements for agricultural families, Rs. 310,465 as house-building loans to other categories of Displaced persons not in transit camps. The administration issued small trade and business loans to Displaced families to the amount of Rs. 45,775, loans to medical practitioners amounting to Rs. 2,900, to lawyers amounting to Rs. 1,500 and agricultural loans amounting to Rs. 5,000.

Language—The vast majority of the population of this district speak Bengali, which in the case of the more respectable classes, differs little from that spoken in Central West Bengal. The agricultural classes, especially those of

Paliya or Rajbanshi origin speak a kind of Bengali *patois* or dialect, which is characterised by a contraction of Bengali words, and by the use of a large number of Urdu and Hindi words, and some words of Central Indian origin. The settlers from the Santal Parganas and Chhotanagpur are commonly bi-lingual, speaking both their own language and Bengali. Bengali is the mother tongue of 561,423 persons, Santali the mother tongue of 54,336 and Hindi the mother tongue of 40,423 persons. Rajbanshi has not been returned as a mother tongue at all. Apparently a few Muslims in the district took it into their head in 1951 to declare Persian as their mother tongue in the 1951 census, 102 of them being males and 85 females.

Religion—The following statement gives the strength of the major religions in the district and the percentage each religion bears to the population of the district.

Religions in West Dinajpur, 1951

	Population	Percentage to population
Hindus	499,327	69.30
Sikhs	18	0.00
Jains	249	0.03
Buddhists	45	0.01
Muslims	215,739	29.94
Christians	3,233	0.45
Other religions :		
Tribal	1,962	0.27

The following is a statement of those scheduled castes and scheduled tribes in the district the strength of each of which exceeds 2,000:—

Scheduled Castes	Males	Females
Bhumali	3,071	2,526
Bhuiya	1,460	1,512
Mahli	1,711	1,254
Muchi	1,629	889
Namosudra	3,751	1,992
Nuniya	1,448	1,047
Paliya	5,713	4,331
Rajbanshi	35,997	31,492
Turi	1,810	1,573
Scheduled Tribes		
Munda	4,562	3,812
Oraon	10,274	10,400
Santal	48,582	46,328

The northern portion of the old district of Dinajpur used to be heavily peopled by Rajbanshis who were commonly confused with the Koches. But the district as at present constituted contains as few as 67,489 Rajbanshis as in the statement above. On the Rajbanshis of north Bengal, the following is quoted from E.A. Gait's Census Report of Bengal, 1901:

The Rajbansis of North Bengal wished to be styled Bhanga or Bratya Kshattriyas, and to be classed amongst the twice-born castes. They tell various stories of their origin, the favourite one being the well-worn legend that their ancestors were the descendants of

Kshattriya families and so must himself have been of the same caste. These legends may at once be rejected; and even if they had some substratum of truth, which does not appear to be the case, they would not affect the estimation in which the caste is held at the present day. At the same time, the enquiries which I have caused to be made seem to show that there is a good foundation for the assertion of the Rajbansis of Rangpur that they have no connection with the Koches, and that the two communities spring from entirely different sources. Though in some places there has been considerable racial inter-mixture, the Rajbansis appear to be a Dravidian tribe, allied, it may be, to the Tiyaars, who often call themselves Rajbansis in the districts south of Rangpur, as far as Nadua and Jessore, and they probably owned the name long before the Mongoloid Koch kings rose to power. When the latter turned to Hinduism they assumed the caste name of the most numerous Hinduised community in their neighbourhood, and, owing to the loose organisation of the original Rajbansis, there was a considerable inter-mingling of the two races while the Koch kings ruled, especially towards the north and north-east where they were most numerous. In Jalpaiguri and Cooch Behar and in Goalpara in Assam, the persons now known as Rajbansis are either pure Koches who, though dark, have a distinctly Mongoloid physiognomy, or else a mixed breed, in which the Koch element usually preponderates. Further away, the Koches did not so readily abandon their old religion and their tribal name, and the original Rajbansis were less willing to mix with them. In Rangpur we find Rajbansis and Koches inhabiting the same villages, but remaining as perfectly distinct communities, with very different physical characteristics. The religion also is different. The Koch worships Siva and eats pork, while the Rajbansis is usually Vaishnava and eschews unclean food. The Kamrupi Brahman serves Rajbansis and Koch alike, but the Maithil Brahmins, who sometimes minister to the Rajbansis, will have nothing to say to the Koches, and the Napit, though he shaves them, does so with some reluctance. The Koches sometimes serve as paliki-bearers but the Rajbansis never do so.

The Muhammadans of West Dinajpur have been described as chiefly descended from Rajbanshis converted to Islam, or having adopted that religion during the days of Muhammadan rule from motives of expediency or policy. The tradition says that Jalal-ud-din, ruler of Gaur about 1420 A.D., himself a converted Hindu, forcibly proselytised all the inhabitants of the district except those who escaped in the neighbouring kingdom of Kamrupa, and there is no doubt that throughout the Muhammadan period the *pirs*, or religious devotees, who exercised much influence with their rulers, made it their business to bring over to their own religion as many as possible of the people amongst whom they lived. The Muhammadan cultivators generally claim the title of Sheikh, though the name that they perhaps more frequently go by is Nasya, meaning one whose original religion has been destroyed, i.e., a convert. I have given an extract on the Muhammadans of Bengal from E.A. Gait's Census Report of 1901, in the book "Tribes and Castes of West Bengal" published by the West Bengal Government in June, 1953. This extract contains much interesting information. But mention must be made here of a curious sect of *Fakirs* in Baliadighi or mauza Balia (J.L. 42), P.S. Raiganj. A brief

account of this sect is quoted below from the Gazetteer of the District dated 1912. The *Fakir* sect, however, does not maintain any distinctive sign or practice today which can mark them off as different from the rest of the local inhabitants.

Mauza Balia in the police station of Raiganj has, since the time of Shah Shuja, been the home of a curious sect of *fakirs*, whose religious practices are a sort of compromise between Muhammadanism and Hindu Jogism. It is said that at one time a Hindu Raja named Bahya lived at this spot, and that the founder of the sect, a *fakir*, named Shah Sultan Hasan Maria Burahna, came and demanded an audience. This being refused he asked for as much land as he could cover with the skin he used for sitting on. His request, which seemed a modest one, was granted, whereupon the skin began to spread till it reached the Raja's palace. The latter, terrified at the portent, drowned himself in the palace tank or *deg*, and the *fakir* got possession of the Raja's estates, which his successors retained till quite recently, when the father of the present *fakir*, embarking on litigation, lost them. Maulvi Abdul Wali, writing in the Journal of the Asiatic Society of Bengal in 1903, thus describes the sect: The beliefs and practices of these *fakirs* are in many ways anti-Islamic. They grow long hair on their head, . . . put on coloured cloths, wear a small piece of cloth instead of breeches called *kolmi* and use shackles of iron and long iron tongs. They sit with thick sticks placed as a support under their arms. They never take food touched by other persons, and subsist mainly on unboiled rice, clarified butter and salt. They do not eat fish or meat. . . . until recent years they lived a life of celibacy. . . . In their tours, they carried the fish standard, called *mahi-a-murath*, and were accompanied by a large retinue. Their title is Burahna or nude; till recently they wore only one simple piece of cloth and even this was probably not worn in earlier times.

The district is almost purely agricultural, and the density being comparatively thin, there is little inclination to leave home and seek employment elsewhere. 150 years ago the district must have been agriculturally very prosperous and elsewhere statistics have been given of the enormous boat traffic of the district. In recent years, even after the Partition, when some of the most fertile areas of the old Dinajpur district have gone over to East Bengal, the district still remains one of the big rice procurement centres of the State, and in 1950 it was estimated that West Dinajpur produced 180,000 tons of cereals net (i.e. after allowing for seed and wastage); the Government procured 40,000 tons that year. In 1951 the district produced about 161,000 tons, the Government procuring about 21,000 tons; in 1953 the Government expects to procure about 17,000 tons of rice in the district. The rise in the prices of agricultural produce which has taken place in recent years, has benefited the agricultural classes, and the isolation of the district from the centres of distraction has encouraged thrifty habits. The district can boast of a very large number of weekly or bi-weekly *hāts* and fairs, and in popular parlance West Dinajpur is described as *hattamelār desh*

or the land of *hāts* and *melās*. Buchanan Hamilton gives a long list of market places, some of which have been identified below, the figures within brackets being J.L. Nos:—

Sadar Subdivision

<i>Balughat P.S.</i>	<i>Gangarampur P.S.</i>
1 Akhura (215)	15 Amgaon (?) (92)
2 Balughat (109)	16 Burinagar (77)
3 Bolla (22)	17 Gangarampur (93)
4 Dharail (68)	18 Kantaban (1)
5 Durlabhpur (58)	19 Mahipur (43)
6 Gobindapur (101)	20 Phulbari (197)
7 Malancha (144)	21 Srinathbati (134)
8 Nazirpur (202)	<i>Tapan P.S.</i>
9 Patiram (187)	22 Bhikharhar (184)
10 Radhanagar (78)	23 Chehra (77)
11 Tior (289)	24 Kardaha (30)
<i>Kumarganj P.S.</i>	25 Naogan (22)
12 Batun (202)	26 Telighata Bhabani-
13 Kumarganj (100)	pur (167)
14 Tara (5)	

Raiganj Subdivision

<i>Kaliaganj P.S.</i>	<i>Hemtabad P.S.</i>
27 Akhanagar (98)	45 Baharail (41)
28 Baidan (129)	46 Dadhikotbari (102)
29 Dahingaon (31)	47 Hemtabad (81)
30 Kunor (164)	48 Samaspur (75)
31 Pakhuria (92)	<i>Banshahari P.S.</i>
32 Ramganj (62)	49 Harirampur (28)
33 Sintar (97)	50 Karai (236)
<i>Uthar P.S.</i>	51 Karanjahari (79)

39 Kachimuha (199)	57 Kalikamora (143)
40 Khalsi (159)	58 Katasan (131)
41 Makdampur (61)	59 Mahipaldighi (190)
42 Panchbhaya (22)	60 Nahit (113)
43 Rayganj (150)	61 Nayapura (57)
44 Tazpur (4)	

PUBLIC HEALTH

The old district of Dinajpur was at all times notorious for unhealthiness. As mentioned before, the presence of ruins and archaeological sites all over the district, the still extant large tanks and the disposition of the means of communication, as well as the history of Barendra and Gaur up to the 16th century, are evidence that the present region of West Dinajpur district was quite populous and full of large prosperous settlements up to the 16th century. This was possible because not many centuries ago the Ganges flowed along the present course of the Mahananda in the Malda district the Kosi down the bed of the Nagar, and the Teesta down the bed of the present Atrai, thus making the territory now constituting the district of West Dinajpur almost entirely a *diara* tract of old alluvium, well-flushed and well-drained, agriculturally fertile and very healthy. Compare the following passage in James Fergusson's *On Recent Changes in the Delta of the Ganges* (see Census of

When Rennell surveyed Purneah, he saw, and recorded in his memoir in the 'Philosophical Transactions',* as well as in his Atlas, that the Coosy had at no distant date flowed past the station at Purneah, and joined the Ganges forty-five miles further down than its present junction. Buchanan Hamilton not only confirms this, but adds: "This tradition is not only supported by the above-mentioned appearance, but by the opinion of the Pundits, or natives of learning, who inhabit its banks. These, indeed, go still further, and allege that in times of remote antiquity the Coosy passed south-east by where Tajpore now is situated, and thence towards the east till it joined the Brahmapootra, having no connexion with the Ganges;" and he adds, "this opinion seems highly probable".** Indeed, an attentive study of the successive changes that have taken place renders this almost certain; and it is probable that the Oorasagur is the mouth by which the combined waters of the Coosy, the Mahanuddee, and the Attree were originally discharged into the Assam river. With the recession of the Kosi and the Ganges further west and south, the district still prospered, however, because of the continuance of the bed of the Teesta down the Atrai as late as 1787. But after 1787 the Teesta deserted its course and commenced to flow through Rangpur district. West Dinajpur, therefore, fell on evil days from 1788. In 1807, Buchanan Hamilton, speaking of natural checks on the increase of population, as would be found in this volume as an appendix, mentioned the extreme feverishness of the district. He also mentioned the extreme poverty and lack of an adequate nourishing diet which accounted for the population falling ready prey to diseases and fever. In this district insalubrity of the climate, feverishness and the poverty of the common people, a large section of which are aboriginal, combined to exercise an inhibitory effect on the population at regular intervals. Major Sherwill, the Revenue Surveyor, writing in 1863, emphasises the dread in which the district was held by strangers.

"The climate", he says, "is very unhealthy, and is justly held in great dislike by strangers, including Bengalis, on account of its insalubrity. When the Second Division, Revenue Survey, was ordered from Burdwan into Dinajpur, many of the oldest and best native Bengali Surveyors resigned, rather than face the dangers of so dreaded a climate. In the seasons of 1857-58 and 1858-59, this survey was nearly disorganised by sickness. As many as 13 surveying parties were unfit for work at the same time, and almost all were sick and weakly from the effects of fever, which

is the prevailing epidemic. The villagers have a sickly appearance, and many are annually carried off by fever and cholera. Natives are more easily affected by the climate than Europeans, which is probably attributable to the freer mode of living of the latter, which enables them the better to withstand its baneful effects, also to the greater exposure of natives to the night air."

The record of vital statistics will be found elsewhere in several tables of this volume. The reader is to be warned that in recent years the registration of vital statistics has deteriorated. At the same time, however, it deserves to be put on record that since 1950, on account of jungle clearance and the resuscitation of a large number of village tanks by the immigrant Displaced population, have improved to some extent the state of malaria in the district, and West Dinajpur is no longer as feverish today as it was a quarter of a century ago.

Still malarial fever is not only the most prevalent, but by far the most deadly, disease. Buchanan Hamilton's remarks still hold good today when he says that fever makes such ample havoc that little room seems to be left for other diseases.

Regarding the types of fever found in Dinajpur, Major Rogers, I.M.S., who was selected by Government in 1904 to make a special enquiry into the causes of the prevalence of fevers in the Dinajpur district, found that the most usual type of fever was the malignant tertian, common to Calcutta and most parts of India. He also found the quartan type, which is said to be the most common in the Duars, and which is usually of a chronic nature, and terminates fatally after several months of sickness. According to this authority, the districts of Rangpur and Dinajpur were the home of the terrible kalā-azar of Assam. During the course of his enquiry in 1904, he found traces of this disease, which is characterised by a great enlargement of the spleen, accompanied by general wasting and darkening of the skin, still surviving in the district. Other common types of fever are simple, tertian, quotidian, and remittent. In 1863 Major Sherwill thought that the north of the district was healthier than the south as there were less jungle there and fewer jungles and marshes. In recent years the converse was found to be true, the present boundaries of West Dinajpur district having proved healthier than the northern portion. The reports of Civil Surgeons are generally of the opinion that the unhealthiness of the district is due to its waterlogged condition. By waterlogging it is not meant that the country is subject to periodical floods and inundations, as is the case with some districts now in East Bengal. On the contrary, to the superficial observer the district seems a

*Vol. lxxi, p. 87.

**Martin, vol. iii, p. 15.

rather dry one, and in the cold weather many parts of it resemble Bihar rather than East Bengal. If indeed the district were left to more frequent floods and inundations it would have been greatly healthier than what it is. As a matter of fact, in the days when the Ganges flowed through the bed of the Mahananda and the Teesta down the Atrai and the country was periodically flooded, all evidence indicates that it was a very healthy country indeed and extremely populous. In reality, the seeming dryness of the district is deceptive. Not only is the country full of old tanks which, being choked with jungle, form an excellent breeding ground for mosquitoes, but even in the height of the dry season water is struck in most parts at a depth of 7 or 8 feet, while in the rains it is very near the surface indeed. This characteristic was especially noticeable in the drought of 1909 and again in the tank excavation programme of 1948-51, when a number of old tanks, most of them completely dried up, were re-excavated as test or relief work. The average depth of water in these tanks when work was started on them was some 7 or 8 feet below the level of the surrounding country. In certain parts of the district the water level is much lower, and these are generally found to be the most healthy localities. In 1904 Major Rogers in his report spoke of "a remarkable relationship between a high ground water level and high spleen rates and fever mortality of the thanas, and *vice versa*." Thus at Porsa the ground water level was 33 feet down, and the spleen rate was only 28.3, the lowest met with, while the fever death rate of 29.05 per thousand was also the lowest of all the thanas. Exactly the reverse holds good of the Ranisankoil circle, in which the highest ground water level coincides with the highest spleen and fever rates. Similarly Dinajpur, Birganj, and Thakurgaon thanas show high ground water levels and spleen and fever rates, while those of Balurghat and Churaman have lower rates approaching those of Porsa." The Public Health Department of the Government have conducted extensive D.D.T. spraying campaigns wherever Displaced persons from East Pakistan have cleared jungle and made homes for themselves.

Cholera—Outbreaks of cholera are of yearly occurrence, but are rarely of a very serious nature. These outbreaks occur generally at the beginning of the cold and the hot seasons, and last for a month or six weeks at a time. It is hard to say that one part of the district is more subject to such outbreaks than another, but the disease usually seems to follow the course of one of the bigger rivers, the infection being doubtless carried by the river water. It is noticeable that in years of deficient rainfall such outbreaks are more marked, and assume more of an epidemic form. The reason why cholera is much less prevalent in this district

than in many others is probably that the population as a whole get their drinking water from wells in their own compounds, and these are naturally much less liable to contamination than public sources of supply, such as tanks and rivers. These wells are, however, seldom deeper than 12 to 15 feet and in a rainless season they run dry and the people are driven to drinking tank or river water, frequently with disastrous results.

Other diseases and infirmities—The diseases next in importance to cholera are dysentery and diarrhoea, which may be classed under one head. The mortality from these is small. In the mango season a kind of choleraic diarrhoea, caused by eating unripe mangoes, is common enough, but seldom ends fatally. Cases reported as small-pox are frequently found on investigation to be really chicken-pox, a comparatively harmless complaint. Buchanan Hamilton speaks of leprosy being common in his day, and says that one person in a hundred was supposed to be affected, and elephantiasis is occasionally seen. The former disease seems to attack women especially, and is most common in the neighbourhood of the Punarbhaba and Atrai rivers.

An account of the dispensaries and hospitals of the district will be found elsewhere in this volume. The hospitals at Raiganj and Balurghat are being greatly extended and modernised, while a number of rural health centres and A. G. hospitals has been established. On account of the influx of the refugee population between 1948 and 1951 there has been a fairly efficient public health staff and a good system of vaccination and inoculation. The district has also benefited through the sinking of a large number of tubewells and the introduction of sanitary, bored-hole latrines. The towns of Balurghat and Raiganj have been converted into municipalities but the lack of funds, the delay of the Government's building programme in Balurghat and Raiganj have helped planless sprawling in both places. Vaccines and lymphs are very quickly made available through the air service between Calcutta and Balurghat.

AGRICULTURE

A brief account has been given above of the geology and soil of the district. In the lower reaches of the Nagar and Punarbhaba and Mahananda rivers, owing to the lowness of the river banks floods are of annual occurrence and large stretches of country are on this account given up to jungle and bear only occasional crops of *boro* which are reaped just before the rivers rise. The *khayr* or clay lands grow, as a rule, only one crop in the year, winter rice. On rare occasions when the rice crop fails, attempts are made to take a second crop of mustard on it, but such attempts are not attended with much success. In the *pali* tracts two crops are usually

grown. Common rotations are autumn rice followed by winter rice or pulse. In the extreme south of the district the *barind* makes its appearance. The higher ground in this tract is generally barren and little attempt is made to cultivate it, though with time and determination this can be done successfully. The low ground is a stiff clay of reddish colour and is excellent winter rice land, though like the *khyar* area it does not lend itself to the cultivation of any other crop.

In his Settlement Report of the district of Dinajpur published in 1942, the Settlement Officer was of the opinion that in both *khyar* and *pali* lands it is possible to introduce entirely new crops, to add to the total produce of the land, and thereby support a larger population, or support the existing population at a higher level. He thought that maize can be well grown as a summer crop. He noticed several patches of maize which he also recognised as excellent cattle fodder. He also commented on the scope for greater production of vegetables both in quantity and variety. Vegetable growing has been taken up extensively by displaced families and the supply of vegetables in all the markets of West Dinajpur is certainly much greater today than it was even four years ago. Tomatoes and potatoes are seen everywhere, as well as the indigenous brinjal, *karala* and *chuchinga*. But very little cabbage, cauliflower, lettuce, turnip or carrot is grown except around Balurghat and Raiganj. The Settlement Officer summed up the present position of agriculture as follows:

One cannot afford to ignore the possibility that under Bengal conditions, and with the Dinajpur cultivator's limited desires, a population of under 600 to the square mile is not enough to grow two crops a year, or to get much more out of the soil than is obtained now. As it is, a great number of Bihari and Santal labourers comes into the district every winter to help with the harvesting. Moreover, it appears that ploughing, harrowing and weeding are all done less thoroughly than in Rangpur. One does not see the ten or a dozen ploughs going round together, that one sees in that district, nor generally, is the soil worked to that fineness which is seen there. Large clods are left about, and the "mugar", or clod-breaking mallet, is comparatively little used. Again, weeding of jute and aush paddy is haphazard. Many people have commented upon the casual or half-hearted way in which the summer crops are weeded in the north of the district. Nor will lack of labour alone explain this, for one does not see the weeders out in the fields in the mid-way heat of April and May, as they are in Rangpur.

Embankments—There are at the present day no embankments of any importance in the district though some traces of earlier works of this nature may be seen here and there. The most noticeable of these embankments is a long straight one called the Mukdam Band, running from Gajol on the Malda border to Raiganj. This embankment dates from Muhammadan

times. Its object was partly to keep out the water of the Nagar river, which almost annually overflows its bank and renders many thousands of acres unculturable, and partly to serve as a highway through the low-lying country on the south-western border. This embankment is now in places some 20 feet high by 30 to 40 feet broad at the base. Another embankment is what is known as the Ushaharan Road, passing across Kushmandi police station towards Churaman.

Irrigation—Irrigation as an agricultural practice can scarcely under normal circumstances be said to exist, although a large number of tanks all over the district points to an extensive system of tank irrigation throughout. Throughout the district tanks are common and numerous. Their depth and high banks are best preserved in the *khyar* country, as in Bansihari, Kusmandi, Gangarampur and Tapan police stations. Their number is legion and in places are so many that one wonders about the thinness of the population in those parts which now look so abandoned. The more famous medieval tanks are the following :

Name of tank		Length at the bottom of the inner side of the tank	Breadth of the bottom of the inner side of the tank
		Yards	Yards
<i>P.S. Gangarampur</i>			
Dhaldighi	. .	1,360	290
Kaladighi	. .	1,320	320
Pransugar	. .	920	240
<i>P.S. Bansihari</i>			
Altadighi	. .	1,280	270
Maliandighi	. .	1,300	300
Gourdighi	. .	1,300	270
<i>P.S. Kusmandi</i>			
Mahipaldighi	. .	1,340	370
<i>P.S. Tapan</i>			
Tapandighi	. .	1,420	400
<i>P.S. Itahar</i>			
Chhatraghatdighi	. .	About 850	350

Of these Dhaldighi, Malyandighi and Altadighi were possibly excavated by Muslim rulers. Pransagar was excavated in the 18th century by the Raja of Dinajpur. In recent years the Government has spent a considerable amount of money in securing irrigation and the excavation of tanks, and the following statement gives an account of the area benefited and the extent of land irrigated by tanks:—

Account of tank improvement during 1950-51 in West Dinajpur
(In accordance with the Bengal Tank Development Act of 1939)

Number of tanks improved	*Expenditure on account of improvement	Area of benefited land (in acres)				Approximate extra yield per year (in tons)		
		One cropped	Two cropped	Current fallows	Total	Kharif	Wheat and other Rabi crops	Fish
West Dinajpur District								
6	15,053	137·66	11·55	0·91	150·12	450	9,987	157
Balurghat Subdivision								
5	13,296	120·28	3·25	0·91	124·44	373	6,862	137
Raiganj Subdivision								
1	1,757	17·38	8·30	..	25·68	77	3,125	20

* Does not include wages of workers. Half of the expenditure is borne by the State and the remaining half is met from the cess on water and irrigation tax which is less than rupee one per bigha.

The channels of the rivers and streams are too deep to lend themselves readily to water-lifts, and irrigation channels and wells are few and far between. In normal years the rainfall is plentiful enough, and irrigation is unnecessary. In dry years some attempt is made, especially in the south of the district, to utilise tanks for irrigation, the water being raised either by triangular mat baskets (*chhenāi*) swung by two

men from ropes tied at the corners, or by hollowed out tree trunks with a weight at one end (*jat*) which are forced down into the water and allowed to spring up so that a stream of water is projected. The following statement gives an account of the minor irrigation and drainage schemes and reclamation of waste lands executed with the help of the Government or by private persons since 1948:

A—Details of Small Irrigation Schemes completed in West Dinajpur during 1950-51

Serial No.	Scheme	Station	Sanctioned	Total			Area of benefited land (in acres)	Approximate extra yield (in tons)

Level—Although the general appearance of the country outside the *barind* tracts is flat, it must not be imagined that the level is everywhere the same. In the *barind* area a skilful system of terracing obtains, similar to what is found in the Terai region of Darjeeling district.

The following extract from the Settlement Report of the district will give a fair idea of the standard of living obtaining before World War II. All recent evidence seems to indicate that the standard has greatly fallen since 1947-

48, the benefit from the rise in price of agricultural produce being nearly liquidated by the rise of price of rice and other articles of use.

An attempt was made to classify families by classes of comfort, on the principles adopted by Major Jack in Faridpur, 30 years ago. Enquiring officers were required to read the tests adopted there, but inevitably a great deal depended upon the inclinations of the different officers, and there were at least four different officers engaged upon the work each year. The results were as follows:

Block	Year	Villages	Comfort		Below comfort		Above starvation		Starvation		Total	
			Families	Persons	Families	Persons	Families	Persons	Families	Persons	Families	Persons
A	1935	11	99	741	196	1,048	12	79	12	62	319	1,930
B	1936	19	101	890	200	1,275	122	643	72	371	495	3,179
C	1937	18	190	1,294	222	1,288	47	234	15	67	474	2,883
D	1938	15	98	661	117	613	154	807	68	300	437	2,381
Total.		63	488	3,586	735	4,224	335	1,763	167	800	1,725	10,373

*Figures in respect of this subdivision could not be obtain as the office started functioning very recently.

It is possible that in 1936 and 1938, the enquiring officers happened upon poorer villages than in the other years, but there is some indication that in 1936 and 1938, officers were more inclined to classify families as in a state of starvation or "above starvation". In 1935 and 1937 only 2 or 3 per cent. of the population are classified as "starving", as in real misery and indigence. In 1936 and 1938 about one-eighth of the population is so classified, which is very serious.

More important than the actual numbers classified under the different heads, are the standards implied by these grade of "comfort" and "starvation". The "below comfort", and "above starvation" classes might perhaps have been placed together, as one class of people in moderate circumstances. Speaking generally, the term "comfort" was understood by all officers to mean a family where there was every appearance of an assured subsistence, according to the standards of the countryside. Families of this class would be those who lived in neat and well kept houses, where the thatch and walls are kept in order; who have such articles as a bedstead or a little wooden furniture, lanterns and umbrellas, and shoes if they choose. The children would appear well nourished, and the adults would have adequate clothing, such as chadars for the cold weather. Such families would also have a supply of solid metal utensils, and would not live solely from hand to mouth. They would probably be able to buy such articles, as gur and salt in bulk, and, not merely a few piec worth at weekly hats.

The middle category would be those who have the minimum of necessary clothing, dhooties, and ganchas, and are restricted to earthenware utensils, or a very few metal utensils, and whose diet, though adequate would exclude a few minor luxuries such as occasional sweets for the children. Such middle grade people are not likely to send their children even to a primary school. But it is believed that all people classified as below comfort or above starvation, are adequately fed.

Officers were told to restrict the starvation class to those actually in want, where the individuals do not

get sufficient to eat, and are forced to live in broken dilapidated houses. The figures strongly suggest that in the first and third years, officers were more reluctant to classify families as in "starvation", than in later years. It must be remembered, however, that enquiries were made between March, or April, and June, fairly soon after the harvest, when there would still be stocks. If enquiries had been made about October, in the khyar one crop areas, the number of people going short might have been larger.

As is only to be expected, the degree of comfort, or standard of living, depends largely upon the size of the family holding. The number of "comfort" families in the under five acre class is rather small, and it is unusual to find any one in the "starvation" class holding over 5 acres. Once again, it must be emphasised that the figures only refer to land held in tenancy right, which in Dinajpur district almost always means "held as a raiyat" and there is no allowance for families which are really non-agricultural. However, as enquiries were made in agricultural villages, it is unlikely that many non-agriculturists have been included. Where a family with a considerable holding of land is classed as starving, it is safe to say that there is some special trouble such as old-age or illness, which prevents the head of the family from working, or more likely that the members are widows and minors and cannot get their lands cultivated properly. Inevitably, the larger families hold larger areas of land, both because co-sharers may keep together, and because in those families which have more land and more means of subsistence, the birth rate, or survival rate among children, is higher.

The results may be summarised as that the families which possess more than 5 or 6 acres of land in tenancy right, generally enjoy satisfactory standard of living. Those who have less and add to their income by working as adhiars or labourers can usually satisfy minimum standards, and do not go hungry, while a fringe of poor people, who include many who have individual misfortunes, is in definite want.

STANDARD OF LIVING AND SIZE OF HOLDING

Year	Number of villages		Over 10 acres		5-10 acres		1-5 acres		Below 1 acre		Total	
			Families	Persons	Families	Persons	Families	Persons	Families	Persons	Families	Persons
1935	11	Comfort . .	47	439	19	130	26	139	7	33	99	741
		Below comfort .	18	169	32	191	92	470	54	318	196	1,048
		Above starvation	1	21	1	6	4	22	6	30	12	79

1938	13	Comfort . .	45	360	26	171	21	97	6	33	98	661
		Below comfort .	19	130	30	181	46	202	22	100	117	613
		Above starvation	8	48	26	164	63	320	57	275	154	807
		Starvation	1	13	18	77	49	210	68	300

The Settlement Report at pp. 26-9 contains additional information on the state of indebtedness of the agricultural classes. Although the

statistics are out of date yet five tables are quoted for historical interest.

RELATION OF INDEBTEDNESS TO STANDARD OF COMFORT OF FAMILY

Block	Year			Comfort	Below comfort	Above starvation		Starvation	Total
		Indebted	Debt free						
A	1935			61		92		1	154
				38		116		11	165
				99		208		12	319
B	1936			49	103		51	21	224
				51	89		70	47	257
				100	192		121	68	481
C	1937			51	92		16	1	160
				63	74		18	5	160
				114	166		34	6	320
D	1938			35	50		70	18	182
				63	58		84	50	255
				98	117		154	68	437

N.B.—Except in the first year there is a general tendency for the "below comfort" medium group to have the heaviest proportion of indebted families.

FREQUENCY OF DEBT

Block	Year	Indebted		Free of debt		Percentage of families		Percentage of persons	
		Families	Persons	Families	Persons	Indebted	Free of debt	Indebted	Free of debt
A	1935	154	1,067	165	863	48	52	55	45
B	1936	224	1,631	257	1,461	47	53	53	47
C	1937	160	1,029	160	851	50	50	55	45
D	1938	182	1,132	255	1,249	42	58	48	52

Consistently, every year, the proportion of families indebted, is lower than that of the individuals indebted, and it is the larger families which are in debt.

RELATION OF INDEBTEDNESS TO SIZE OF HOLDING

Block	Year	Number of families holding						Total			
		Indebted	Debt free	Over 10 acres	5-10 acres	1-5 acres	Under 1 acre				
A	1935	Indebted	46	30	65	13	154
		Debt free	20	22	61	62	165
B	1936	Indebted	51	69	92	12	224
		Debt free	36	48	132	41	257
C	1937	Indebted	29	51	55	23	158*
		Debt free	20	23	50	65	160
D	1938	Indebted	30	41	64	47	182
		Debt free	42	40	86	87	255

* 2 doubtful cases.

There is a notable absence of debt among the landless class.

EXTENT OF TRANSFER OF LANDS FROM AGRICULTURISTS TO NON-AGRICULTURISTS

The following account of agricultural implements is taken from pp. 40-1 of the Settlement Report of the district.

The implements of agriculture are the familiar ploughs, ladders and rakes, used throughout Bengal, and depicted by artists over many centuries. The wood of the ploughshare may be sal, mango or jack fruit as available. Where local sal is found, it is preferred, but there is no import of ploughshares. A share would cost 8 to 12 annas, and may be shaped by the cultivator himself, or by a neighbour who has wood, and a flair for elementary carpentry. It will be set with an iron tip, price about 2 annas, by a local blacksmith. In different parts of the district there are slightly different types of plough, including one in the far north, called the Nepal plough. But the only apparent difference is in the angle at which the handle is set back on the share, and the method of holding the handle. The yoke is of some "country wood", mango, jack fruit, nim and "harai" or wild plum, all being used; though in places, yokes are made of stout bamboos, these being specially favoured when ploughing with buffaloes. The "ish" which connects the plough share with the yoke, is frequently made of strong Nepal or Duars "sal", for it is the most fragile part of the plough. Such an "ish" is reckoned to last 10 or 12 years, but costs only a rupee. A share will last for a season, but may require two tips, and so the total cost of the plough is only 1 rupee to 1 rupee 4 annas a year. This country plough is evidently proved by long experience to be well suited to the country. It is extremely cheap, and

has the great merit of lightness, for it can be carried on the shoulder without difficulty, which is more than can be said for improved types of plough. The only places where such have been seen are on the khas lands of the Setabganj mill; a farm near Biral, where there is a tractor, and in the office of an Agricultural Demonstrator. The stock statement shows 298,386 ploughs in the district compared with 278,683 in the census of 1930, giving an average of 1 plough to 6½ acres of land sown.

The "mai", or ladder, of two bamboos, joined together with a number of cross bars, is widely used to break up the clods, and to smooth out the ploughed soil. Near Raiganj, a "chungu" of heavy simul wood plank is used for the same purpose, but requires two riders instead of one, to hold it down to the ground.

The "bedha" or "languliya" is used for thinning and weeding aush paddy and jute. It consists of a dozen sharp bamboo teeth set in a wooden bar, and drawn by the cattle, with a bamboo "ish". It is cheaper than the plough. For hand weeding, "dauls" of local iron, set in a wood or horn handle, and costing 4 or 5 pice, are used, and the sickle, with a saw-toothed edge costs about the same. The implements of cultivation apart from the cattle are thus extremely inexpensive, and are one of the smallest items of the cultivator's budget. Carts are common throughout the district. 81,756 are noted in the stock list, a number very close to the 80,058 shown in the census of 1930, when this district had more than any other except Burdwan. The ex-

pensive part of the cart is the wheels. These are always of some good hard wood, such as "babla" or "sal", and are made by wheelwrights who specialize in such work. A few wheelwrights who are always Hindustanis may be found in most big bazars, with permanent shops, and wheels, like other expensive things, can be bought at the *melas*. Wheels cost up to 16 rupees a pair, and these good wheels will last several years though the iron rim must be renewed. The axle, and supports are often of local wood, and the body of the cart is a bamboo platform made by the owner himself. Factors which encourage the widespread use of carts in the district, are (a) the dry character of the district, which has so few rivers; (b) the dependence of much of the district upon the export of paddy to distant railway stations, or "bandars" on the Atrai and Punarbhaba and (c) the large holdings of many jotedars, and the distance of some lands from the homestead.

In the matter of agricultural implements very little improvement has been made and there is not much of tractor cultivation either. Only in the case of refugee settlement the Agricultural Department in certain cases have broken up the land with tractors and given it a first harrow. There are several demonstration farms of 5 acres each in the rural areas. They have not been very successful in the propagation of improved cultivation and adoption of improved implements.

Damage by wild animals—Up to comparatively recent times considerable damage to crops was caused by wild buffalo, deer and pig. Nowadays the former may be said to be extinct, while the latter are now surviving in a few localities. Jungle fowls have disappeared. Small birds and rats cause some injury, especially to the rice crop.

Manure—The Settlement Officer wrote that the Dinajpur cultivator is well aware of the value of manure, and indeed during his journeys the traveller could see neat cones of cowdung and also of *gala*, earth dug out from tanks pitted throughout the paddy stubbles, ready for ploughing in, as soon as the rains break. There is no accepted standard of manuring, but generally cultivators give the land all they have got, but farmyard manure is rarely bought and sold. In the *khyar* lands of the south, ponds and tanks are cleaned out, and the earth so excavated has long been known as a good manure. Here, the quantity of manure given to the soil, is considerable; amounting to some 80 to 100 cartloads an acre, and each cart may contain some 8 maunds. Owners of tanks commonly allow any one who wishes, to take mud for his fields and there is often an immemorial custom that this may be done. Occasionally, this was entered as a right in the easement form, but the custom is being rapidly discontinued. Cowdung or *gobor* is often mixed with household ash and carted on to the land after being pitted, or put on a heap during the year. There is a shortage of wood in the well-cultivated *khyar* lands of the south, and dung cakes are used as fuel.

Much heavier manuring is given for sugarcane, and for special crops like *pan*. Mustard oilcake is sometimes given as a manure to sugarcane, and here the ashes of the cane, used to boil the *gur*, go back into the soil as manure.

The following statement reproduced for convenience from a table in this volume shows the pattern of land management in this district.

LAND EMPLOYMENT IN 1951-52		Acres
1	Total area not available for cultivation (current fallows, culturable area other than current fallows, and area not available for cultivation)	201,171·56
2	Area not available for cultivation (uncultivable waste)	93,250·59
3	Culturable area (cultivable waste and current fallows)	99,319·44
4	Current fallows	8,995·88
5	Total area sown	657,119·56
6	Dofash	95,495·04
7	Net area sown	663,614·60
8	Area under Bhadoi crops	110,598·57
9	Area under Aghani or Aman crops	487,317·78
10	Area under Rabi or Kharif crops	101,239·74
11	Others, <i>e.g.</i> , mango, tea, <i>pan</i> , plantain, guava, etc.	15,889·18

STATEMENT OF CROPS		Acres
Area of Aus rice		67,740
Area of Aman rice		447,543·24
Area of Boro rice		86

Area under linseed		162·38
Area under til or sesamum		425
Area under rape and mustard		26,449·05
Area under sugarcane		1,554·94
Area under fodder crops (joar and kharai)		1,578·79
Area under potato		3,218·32
Area under orchards		11,033·05

It will appear from this statement as well as Appendix II published in this volume that there has been a considerable extension of cultivation in recent years. A comparative statement published in the volume called *An Account of Land Management in West Bengal, 1870-1950* compiled by me and published by the West Bengal Government, will show that between 1900 and 1930 there was very little extension of cultivation. In 1912, F. W. Strong, writing the Gazetteer of Dinajpur district observed that an accurate estimate of the rate at which cultivation of the district has extended is impossible, as the cultivated area has never been properly ascertained. In his Settlement Report published in 1942, F. O. Bell gave a shocking illustration of the inadequacy of agricultural statistics published in 1936-37. At p. 37 of his report he observed as follows:—

It is a profitable diversion, to compare the figures of cultivation and different crops as ascertained in settlement, with previously accepted figures. This is

done, not to disparage the work of the Collector, the Agricultural Department, or any one else, but only to show how an accurate field to field crop survey will upset pre-existing ideas of essential facts, based purely on conjecture, and how without proper data, we all grope in the dark. For comparison, the settlement figures which are a compilation of four different years are shown against those included in Agricultural Statistics of Bengal for the year 1936-37, i.e., ending on 30th June 1937.

Total area and classification of area:—

	Settlement area	Agricultural statistics, 1936-37
Total area	2,522,900	2,526,720
Not available for cultivation	237,620	500,000
Culturable waste other than fallows	333,007	267,060
Current fallows	89,658	639,760
Net area sown during the year	1,862,615	1,119,900

The net sown area is thus found to be actually about two-thirds as large again as that given in Agricultural Statistics, 1936-37, and the 'current fallows' less than one-seventh of the area given there. Current fallow in the Settlement figures, means land fallow for three years or less, and presumably the words have the same meaning in Agricultural Statistics.

The same difference is found by a comparison of the area sown with certain important crops:—

	Area in settlement crop statements	Area in Agricultural Statistics, 1936-37
Rice	1,629,246	901,300
Barley	7,715	200
Maize	4,489	1,000
Rape and mustard	124,821	57,200
Sugarcane	30,546	52,700
Jute	90,961	63,000
Tobacco	7,496	13,000

The Settlement figures prove the area sown with rice, to be nearly twice the area given in agricultural statistics, while the mustard area is more than twice the area there entered. Jute also shows a much greater area than that believed to be under the crop, while sugarcane and tobacco actually cover far less than the supposed area. There could be no stronger argument for maintenance of the Settlement Department, if only to secure accurate crop statistics.

It is probable that between the beginning of the 19th century and the time of the Revenue Survey in 1861-3 there was little progress made in extending cultivation as the Revenue Surveyor, Major Sherwill, speaks of large tracts being covered with dense tree and grass jungle infested with wild animals. After the famine of 1873-4 prices of foodgrains began to rise and agriculture began to assume a more attractive aspect. As the local cultivators were ill-suited to the hard work involved in clearing heavy jungle, the manager of a Wards estate made the experiment of importing Santals from the Santal Parganas. The experiment was attended with

such success that many zemindars imitated his example and since then these settlers have been migrating into the district in ever increasing numbers, with the result that these extensive jungle tracts are being brought under cultivation to a great extent. It must not be supposed that these Santal settlers retain possession of all the jungle lands that they have cleared. The general practice is for the zemindar to settle the lands to be cleared with them for a period of years at a very low rent. At the expiry of the period, the lands having been brought under cultivation and having greatly gone up in value in consequence, the rent is raised to the level of that of similar lands in the neighbourhood, whereupon the Santals promptly move on to some other spot where uncultivated waste lands are to be had, while the native Bengali cultivators take their place. This has been not a little responsible for a great deal of Santal unrest in the district, especially in the last two decades, when the limit in the extension of cultivation has been nearly reached. The Santal is more normally now retained as a *barqadar* or agricultural day labourer even where he is cheated on account of his innocence and the community, the biggest stay of agriculture, in the district, remains perpetually dissatisfied and a potential source of unrest. Such an unrest broke out in 1948 when it had to be quelled by opening fire upon unruly crowds in several places.

Crops—The principal crops are winter rice (*haimantik* or *aman*), jute, autumn or *bhadoi* rice, rape and mustard, sugarcane, cold weather crops such as pulses, tobacco and vegetables. Winter rice is by far the most important crop. Bhadoi rice, though comparatively inferior is nevertheless grown on a considerable scale. On the cultivation of rice the account of Buchanan Hamilton published as an appendix elsewhere in this volume is exhaustive and still holds good for the district. The most important money crop is jute, and there has been a marked increase in the cultivation of this staple throughout the present century. Buchanan Hamilton speaks of it as a fibre in general use in his day for making cordage, gunny bags, and even coarse cloths. Up to the time of Major Sherwill, 1863, jute was raised for local consumption only in a very small quantity, but in the present century Raiganj and Hili have been two of the most important jute exporting centres of Dinajpur district, and after the Partition, Raiganj is one of the busiest export centres of jute.

Rape and mustard are the two important oilseeds. They are cold weather crops and are grown on high lands especially along the banks of rivers and near homesteads. The principal thanas where these crops are grown are Raiganj and Kaliaganj.

Sugarcane also occupies an important place and a thriving industry exists on the crushing of sugarcane in the winter and the manufacture of *gur* or refined sugar.

Tobacco also is grown on a considerable area, but the finer tobacco lands have fallen to the lot of East Bengal.

Chillies are an important crop in Kaliaganj. The seed is sown in October and transplanted in November. Before transplanting the surface of the land is reduced to a fine tilth by laddering and the seedlings are planted in parallel furrows. They are watered at the time of planting. Chillies ripen in April and are plucked by women and children. Plucking continues till the end of May. After being dried the chillies are sold in the local market or exported. They are a very profitable crop to grow and there is great demand for them.

The only other crops demanding mention are pulses. Of these the most important are *arhar* and *matar*, in Kaliaganj and Kusmandi. *Matar* is sometimes sown in the standing winter rice about the end of October and ripens after the rice is cut, but the general practice of turning the cattle and goats loose to graze over the face of the country immediately after the winter rice is cut restricts this practice to a great extent and indeed acts as a serious check on the growing of such cold weather crops generally.

The following is an account of the varieties of crops grown in the district and the diseases, blights and pests they are liable to; the list has been kindly furnished by the Superintendent of Agriculture, Malda, West Dinajpur.

Raiganj Subdivision

- Rice*: { Boro—Bora. Only one variety.
Aus—Duni, Dhanra, Suni, Jana, Satia, Bhadra, Dharia.
Aman—Sapandari, Kalam, Indrasail, Chenga, Jhaulani, Kataribhog, Dwariakasail, Kalamili, Katarisail, Patnai, Dadkhani, Badsabhog, Bhasamanik, Tilakkachuir, Malsara, Satia, Boona.
- Jute*: Deshi (*Capsularius*). Tosha (*Olitorious*). Mesta.
- Sugarcane*: C.O. 421, C.O. 527, Gandari Bahwari, Kajali Dhalsingh.

Pests

- Paddy*: Rice stem borer, Rice Hispa, Rice bug, Rice case worm, Rice crab (though not an insect but causing damage to a considerable extent to paddy crop).
- Sugarcane*: Sugarcane stem borer, top shoot borer, whiteant.
- Jute*: Jute hairy caterpillar, jute semiloper.

Vegetable: Cut worm, Aphis, Brinjal fruit borer, Pumpkin beetle, Hairy caterpillar, Lady bird beetle, Dimand back moth.

Fruit: Fruit fly, Fruit sucking moth, Red ants, Mango stem borer, Mamma store borer, Mango beetle.

Disease

Paddy: Rice Bala, Root Rot.

Jute: Mosaic, Stem Rot.

Sugarcane: Red Rot.

Vegetable: Bunchy top of brinjal, Mosaic disease or beams, Leaf rot of cabbage, Canker.

Balurghat Subdivision

- Rice*: { Aman—Dudsar; Darikasail; Kartiksail; Kataribhog; Indrasail; Jabarsail; Jashoa; Chinisakker; Radhunipagol; Kulani; Bankalam; Nagrikalam; Bhadri; Painati; Dudkalam; Mahipal; Sonasail; Begunbichi; Bhasamanik; Silkumal; Gajargaria; Patnai; Parbatjhari; Tilakkachari; Dadkhani; Latisail; Patiali; Kalamani; Bhowri Jhanki; Bashful;
Deep-water paddy: Baisbish; Malia bhangore; Gabura.
Aus—Jali aus; Jama; Dumra Bhadoi; Ujal; Bakrijali; Dharijal; Katakara; Charnak; Sharsapani; Marichbuti; Dular; Bhutmuri.
Boro—Sada boro; Tulsi boro; Dharijal; Khaiya boro; Aman boro.

Jute:

- Capsularies: Tebra; Khashabombai; Meghlal; D-154.
- Olitorious: Madhai; Bheli; Kochan; Chinsura green.
- Mesta: Mesta.

Sugarcane: Kajali; Bombai; Bhehnamukhi; Kheri; Gandari; Moghi; Fulkheri; C.O. 421; C.O. 527.

Insect pests and diseases

Paddy:

- Insect—Swarming caterpillar; ricecut worm; stemborer; rice grasshopper; paddy bug; rice hispa.
- Disease—*Pyricularia*, *Helminthosporium*.

Jute:

- Insect—Hairy caterpillar; jute semiloper.
- Disease—Root Rot; *Macrophomina Phaseoli* (Stem Rot).

Sugarcane:

- Insects—Top shootborer by—*Scirpophagu Nivella*; Stem borer by *Argyria Tumidicostalis*; Whiteants (Termites).

- (b) **Disease**—(i) Red Rot (Dhosa), (ii) Smut disease (Bhosa).

Vegetables: Swarming caterpillar; hairy caterpillar; Epitachna and Red pumpkin beetle; Potato tuber moth.

Betel: Disease—Root Rot; Leaf Rot

Fruit Orchard: Insects—Mango hopper.

Mulberries: Nil.

Yield per acre—Buchanan Hamilton in 1807-08 quoted some farm accounts given to him by some actual cultivators, and this placed the actual yield of *aman* paddy grown as a single crop at 30 maunds an acre, and from 18 to 36, with an average of 28.

The cultivators' own statements and cultivators are no more likely to have overstated their crops then than now. Sherwill's Revenue Survey Report did not venture to give any Revenue Survey of yield, but in 1870 the Collector of the district reported to W. W. Hunter that a good average yield from land being from Re. 1-8 per bigha, yields from 8 to 10 maunds, i.e., 24 to 30 maunds an acre. Even in 1870 W. W. Hunter remarked: "The soil appears to have decreased in productive power by over cropping; and it is said that the land now produces less by one-fifth than what it did twenty-five years ago." The Director of Agriculture in 1937-8 estimated the yield of *aman* paddy per acre at 21 maunds. The Settlement Officer in his report dated 1942 believed that this was somewhat too high. According to the Settlement Officer the average yield of winter rice as shown by 280 experiments on a 10th of an acre, conducted by staff of the Settlement Department, appears to be 17 maunds to the acre. In the absence, however, of systematic crop-cutting experiments over a long period, no definite assertion is possible that the fertility of the soil is decreasing.

That the district has always exported large quantities of foodgrains has never been in doubt. In 1870 W. W. Hunter mentioned the following places as the principal river-side trading villages and produce-depôts within the present boundaries of West Dinajpur district:

- (1) On the Mahananda. Churaman
- (2) On the Nagar, Kaliaganj, Madanmala, Jagadal, Haripur, Kasipur and Naypur
- (3) On the Kulik, Raiganj
- (4) On the Tangan, Sibpur, Nischintapur and Bansihari
- (5) On the Punarbhaba, Damduma, Champatala, Nayabazar, Chaluapati, Ghugudanga, Nayabandar, Gangarampur and Kardaha

- (6) On the Jamuna, Fulbari and Khayerbari
- (7) On the Atrai, Samjia, Kumarganj, Patiram, Rangamati, Chakgopal and Balurghat

The following account reproduced from pp. 411-4 of W. W. Hunter's Statistical Account of Dinajpur will be of great interest as showing what an important place rice exports then as now held in the economic life of the district.

The trade of Dinajpur with the North-Western Provinces consists almost entirely of the export of rice. The registration station at Sahibganj returns only the actual shipping marts; and as a great portion of the grain produced in the rice-fields of Dinajpur is shipped from large river-side produce depôts in Malda, it is necessary to combine the Sahibganj returns for both Malda and Dinajpur, in order to learn the total exports from the latter District. In 1872 the total quantity of rice which passed Sahibganj from Dinajpur and Malda Districts amounted to 1,628,794 maunds or 59,625 tons; and in 1873, to 1,538,898 maunds or 56,334 tons. In the famine year of 1874, the exports, even from a great rice-producing District like Dinajpur, almost entirely ceased. In that year the exports of rice from Malda and Dinajpur combined amounted only to 53,275 maunds or 1,950 tons. In ordinary years, the great bulk of all the rice sent upcountry from Bengal is despatched from Malda and Dinajpur, by far the greater portion being grown in the latter District. The principal marts are Nipur on the Punarbhaba, which in 1873 exported 377,928 maunds or 12,370 tons; Rohanpur, 407,489 maunds or 14,917 tons; Raiganj on the Kulik, 80,462 maunds or 2,945 tons; Asuni on the Tangan, 95,151 maunds or 3,483 tons; and Kalkamara on the Tangan, 71,223 maunds or 2,607 tons; and Champatala, Dinajpur, Nawabazar, and Nayabandar, all on the Punarbhaba. Besides these, there is the large mart of Gopalganj, which does not appear in the Sahibganj returns, but from which a former Collector, Mr. Robinson, estimated that the exports could not be less than 180,000 maunds or 6,589 tons. Mr. Robinson estimated that the quantity of rice exported from Dinajpur upcountry was 1,700,000 or 1,800,000 maunds, or from 62,232 to 65,892 tons, exclusive of the Malda rice, which the late Collector of that District estimated at 250,000 maunds or 9,151 tons. Mr. Robinson is of opinion that the Sahibganj returns very much underestimate the quantity of the exports from Dinajpur; but this probably arises from the difficulty of distinguishing between Malda and Dinajpur rice, under the system hitherto in force. A more accurate system of registration has now been established.

Of the total surplus rice of Dinajpur, it is roughly estimated that one-half is exported to the North-Western Provinces by way of the Tangan, Kulik, Punarbhaba, and other streams, into the Mahananda, and so into the Ganges; and that the remaining half is exported southwards. Most of the exports to Calcutta come by way of the Atrai into the Matabhanga. A little also finds its way down the Mahananda and on to Calcutta by way of the Jalangi route. The traffic from the Atrai river to Calcutta goes almost entirely down the Matabhanga till the middle of October; after which, if the Matabhanga gets dry, it goes round by the Sundarbans, or by way of the Eastern Bengal Railway. The returns of traffic from the Matabhanga during 1872 and 1873 give a detailed account of exports to Calcutta of rice from the under-mentioned marts, as follows:—(1) Patiram—rice exported in 1872, 115,491 maunds or 4,227 tons; in 1873, 112,021 maunds or 4,100 tons. (2) Kumarganj—exports in 1872, 94,875 maunds or 3,473 tons; in 1873, 114,818 maunds or 4,203 tons. (3) Chandganj—exports in 1872,

59,000 maunds or 2,159 tons; in 1873, 82,034 maunds or 3,003 tons (4) Kaliaganj—exports in 1872, 44,294 maunds or 1,621 tons; in 1873, 57,733 maunds or 2,113 tons. (5) Chak Gopal—exports in 1872, 42,004 maunds or 1,537 tons; in 1873, 43,365 maunds or 1,542 tons. (6) Fakirganj—exports in 1872, 77,162 maunds or 2,824 tons; in 1873, 54,921 maunds or 2,010 tons. (7) Jiban Bazar or Goraghat—exports in 1872, 67,600 maunds or 2,474 tons; in 1873, nil. (8) Rangamati—exports in 1872, 63,350 maunds or 2,319 tons; in 1873, 58,815 maunds or 2,153 tons. (9) Pugh-bandar—exports in 1872, 46,050 maunds or 1,685 tons; in 1873, 49,669 maunds or 1,818 tons. (10) Samjia—exports in 1872, nil; in 1873, 56,478 maunds or 2,067 tons. (11) Madanganj—exports in 1872, nil; in 1873, 12,780 maunds or 467 tons. (12) Brahmapur—exports in 1872, nil; in 1873, 20,370 maunds or 745 tons. (13) Balughat—exports in 1872, nil; in 1873, 34,383 maunds or 1,258 tons. (14) Hili—exports in 1872, 234,598 maunds or 8,587 tons; in 1873, 38,283 maunds or 1,401 tons. (15) Small places—exports in 1872, nil; in 1873, 53,750 maunds or 1,967 tons. Total in 1872, 844,424 maunds or 30,822 tons; in 1873, 789,420 maunds or 28,895 tons. The whole of this, however, is not Dinajpur produce. A great deal of the rice of the west and south-west of Rangpur District is collected at the Dinajpur marts on the Atrai and Karatoya, and so sent to Calcutta.

Of the foregoing marts, Patiram, Kumarganj, Chandganj, Kaliaganj, Chak Gopal, Fakirganj, Rangamati, Pughbandar, Samjia, Brahmapur, and Balughat are all on the Atrai river and in Dinajpur District. Jiban Bazar or Goraghat is on the Karatoya. Hili is on the

Jamuna, and in Bogra District, but largely exports Dinajpur rice, and is therefore returned here. All these marts are in close proximity to each other. Mr. Robinson seems to consider these returns of exports to be understated. When Collector of the District in 1873, he estimated that the total export of rice from these marts could not be less than 1,500,000 maunds or 54,910 tons. Of this amount, it appears that from 800,000 to 1,000,000 maunds, or from 29,285 to 36,607 tons are consigned down the Matabhanga river to Calcutta; it is known that at least 200,000 maunds or 29,285 tons are conveyed by the Eastern Bengal Railway; a small quantity, probably from 10,000 to 20,000 maunds, or from 366 to 722 tons, follows the canal route; and the remainder probably finds its way into Districts south of the Ganges for local consumption. In the winter of 1873 the crops of this large rice-producing tract failed, and the registered exports in 1874 did not exceed 10,000 maunds or 366 tons altogether. The rice exported by way of the Mahamanda and Jalangi amounted in 1873 to 25,000 maunds or 915 tons from Dinajpur, 53,000 maunds or 1,940 tons from Maldah, and 120,000 maunds or 4,392 tons from the large mart of Hili in Bogra.

With the above statement may be compared the figures of export of paddy, rice, pulses, jute and oilseeds from the railway stations of Raiaganj, Kaliaganj, Radhikapur and Hili between the years 1936 and 1939, reproduced from pp. 49-50 of the Settlement Report for the district:—

Station	Year	Paddy		Rice		Gram and Pulse		Jute		Kerosene oil		Oil-seeds

N.B.—All figures are in standard maunds.

Fruits and vegetables.—Cultivation of fruits and vegetables includes bananas, mangoes, jack fruit and pineapples. Of bananas there are many varieties, some, such as the *chini champa* and *wālbhog*, being particularly popular and well flavoured. This fruit is grown near every homestead and is an important article in the diet of the people and a necessary part of offerings to gods and in all religious ceremonies. Mango trees are common but generally little trouble is taken in their cultivation and the fruit has very little merit. The best varieties of mango are the *gopālbhog*, *fazli* and *lambā bhāduri*. Jack fruit almost as common in every village as bananas. They need practically no cultivation and bear heavily. Probably for

this reason they, like the plantain, have little market value, though these are freely taken by all people. Pineapples are very generally cultivated, but are rather poor. Other cultivated fruits are pummelos, *pāpiyās*, and *litchis*, of which a few trees may be found here and there. Among wild fruits found in the district may be mentioned the tamarind, *boir*, *jam* and *bel*; these fruits are common enough and may often be found growing near villages. Date trees grow wild in considerable numbers in the southern portion of the district, especially in the thanas of Gangarampur and Tapan, but the fruit is of little worth. These date-palms are commonly tapped for toddy, which is drunk unfermented or made into treacle. The palmyra

palm or *tāl* is most commonly found in the thanas of Gangarampur, Itahar, Bansihari and Tapan. The toddy obtained from this tree is generally drunk after fermentation though sometimes it is taken unfermented. Except in the bazars, every homestead or *bari* has its garden where a large variety of vegetables are grown for home consumption. The principal vegetables grown for the market are brinjal, potato, sweet potato, radish, a small arum and various kinds of cucumbers, gourds, and pumpkins. Brinjals are quite fine in the south. Turmeric and onions are grown to some extent and beans and *dantasag* a kind of spinach, are produced for home consumption. *Patsag*, a variety of jute, is used by the poorer classes as a vegetable, being eaten young.

In recent years the cultivation of such vegetables as cauliflower, cabbage, carrot, lettuce, turnip, etc., or the so-called European vegetables has received much encouragement, and the town of Balurghat at any rate receives a good supply. The cultivation of tobacco has also improved. Wheat is being introduced in several areas with much success, as well as groundnut in Hemtabad and Raiganj.

Cattle—The local breed of cattle resembles that in most other parts of the State, being small and weak. No attempt at systematic breeding is made, and the improvement of live-stock-programme of the State which aims at upgrading the cattle by introducing improved types of bulls and artificial insemination centres in particular areas, while castrating or otherwise removing indigenous scrub bulls of that locality, has not yet been effective in this district. The necessity of reserving grazing areas and for growing fodder crops has never been seriously considered. The local cattle, owing to their small size and weakness, are unfit for heavy and intensive ploughing and are also very poor milkers. Every year, however, the local stock is replenished by the importation of large numbers of fine draft bullocks bought at the big fairs and *melas* of the district, in which live-stock is imported from Bihar and U. P. The people are thus saved the trouble of breeding their own cart bullocks, while for ploughing purposes they are content with the small animals locally available. The buffaloes found in the district are generally imported, although even the imported breed is small. The buffalo is used for drawing carts, but in the *khyar* lands where the land is hard and the soil heavy, the buffalo draws the plough as well. The Settlement Officer of the district used the following *mot juste*: "If the Bihar bullock is the touring car of the *jotdar*, the buffalo is his lorry." This creature is more extensively employed in West Dinajpur than even in Malda. Like the bullock, the buffalo has to serve two purposes, to draw the plough and to draw the

cart. He is especially favoured in the heavy clay *khyar* lands because of greater strength and ability to pull the plough through the sticky soil. Santals are adept in using buffaloes with the plough. Milch buffaloes are kept in small numbers in the low-lying country on the lower reaches of the Punarbhaba. Goats of a small short-legged type are common. In the cold weather flocks of large castrated goats are imported from Bihar for slaughter. Small flocks of sheep are reared in Hemtabad and Itahar thanas. The local poultry are of a small type, but improved strengths of Rhode Island Reds are reared by private gentlemen and farmers in Gangarampur and Balurghat. There is a sturdy variety of local duck in Kaliaganj.

Pasturage—The staple cattle fodder is paddy straw and most cattle are stall fed. Only after the harvest are cattle let loose to crop off the stubble, which constitutes probably the only pasture that the cattle can get at. A small amount of *kalai* and *matar* is grown in Kaliaganj and Gangarampur as cattle fodder. There are very few grass lands, but in the western thanas there are coppices on which the cattle are let loose. The better class of peasantry feed their cattle some mustard oil cake and *khari* salt. Very little *napier* grass is grown and there is nothing like an organised attempt of creating pasture land.

West Dinajpur does not suffer very much from cattle disease, the reason being that very infrequently is the land wholly inundated. The veterinary service available, however, does not seem to be adequate.

NATURAL CALAMITIES

The following is a bare chronological account of the natural calamities that have visited the district since the 19th century :—

Chronological List of Natural Calamities District—West Dinajpur

1865—Famine (minor)	
1866—Famine (minor)	
1873—Famine	
1874—Famine	
1891—Scarcity (severe)	•
1892—Flood—(9th July)	•
1897—Earthquake	
Scarcity	
1908—Scarcity

OCCUPATIONS, MANUFACTURES AND TRADE

Occupations—The district is almost entirely agricultural. In the census of 1951 it was found that about 48 per cent. of the total population

were dependent on the cultivation of land owned, about 26 per cent. were dependent on the *barga* system of cultivation about 10 per cent. on landless agricultural wages, and about 0.5 per cent. on the receipts of *zemindari* dues. These agricultural livelihoods account for about 85 per cent. of the population. The small ratio that the rent-receiving interests bear to the rent paying interests is proof of the enormous concentration of the proprietary rights of the soil in the hands of a very few persons. Industries are of little importance and only 2.79% of the present population are supported by them. In 1911 the proportion was 3%. 3.89 per cent. of the population are supported by commerce, 0.47 per cent. by the various means of transport, and 7.67 per cent. of the population are supported by other services and miscellaneous sources. This last category which covers the professional classes has increased from under 1 per cent. in 1911. The ratio between the cultivators of land owned and agricultural labourers is wider than in any other district, which explains to some extent why so much labour is imported during the harvesting and sowing seasons from Bihar. Of organised industry there is very little. There are only a few rice mills in Hili, Kaliaganj, Balurghat, Kardaha, Bansihari, etc. Raiganj has a few establishments for handling jute. As few as 58 persons earn their living by stock-raising. 523 persons live by fishing (as distinguished from dealing in fish). 1,802 persons live by husking grains and pulses, of whom 1,035 are women. There are few millers of oil: only 157 oilmen ply their industry throughout the district. Handlooms do not play an important part, as only 385 persons earn their livelihood mainly through handlooms and allied industries. There are as few as 253 cobblers and persons engaged in making leather products, 265 blacksmiths, and 319 workers in other metals including brass and bell metal. There are 169 registered practitioners, of whom 4 are women; only about 907 persons are engaged in the educational services and research; the number of lawyers in all the district is only 91.

As already mentioned, manufacture in the general meaning of the term on anything like a large-scale is practically non-existent.

17 rice mills were registered in 1951 with the Chief Inspector of Factories, West Bengal, of which 2 were located in Raiganj, 10 in Hili, 2 in Kaliaganj and 1 each in Bangalbari, Dalimgaon and Durgapur. A few more are being newly built in several places, as already noted.

Rice husking was at one time a fairly important industry, which has been replaced by a number of modern rice mills. The manufacture of *jaggery* or *gur* from sugarcane is carried on quite extensively. The crushing of the cane, or

the boiling of the juice to make the *gur* is generally done by the cultivators themselves. The wooden or stone mills for crushing the cane have been replaced by iron mills. The usual practice is for several families to combine to hire a mill between them, thus reducing the cost and ensuring a sufficient supply of cane to keep the mill fully occupied. A mill is worked by a pair of bullocks walking in a circle. The juice is boiled in shallow iron pans placed one below another in series, the refuse cane, after it has been squeezed dry, being used for the fire. The finished product is purified with milk and other purifiers before it is poured out into earthen jars in which it is allowed to solidify. Most of the *gur* manufactured is consumed locally, being a staple article of diet amongst the people of the district.

Fisheries—There is reason to believe that at one time the district was a great country for fish. Perhaps during the period when it formed a large *diara* tract between the Ganges and the Teesta. It was known, indeed, in ancient times as Matsyadesh. The silting up of the rivers and the recession of the Ganges and the Teesta have been perhaps responsible for the decline of this industry. The habits of inhabitants have also changed. Large numbers of Rajbansis, who formerly followed fishing as an occupation, have now taken to agriculture as both more profitable and respectable. The number of fishermen families is now very small and their methods primitive. A very detailed account of fishing and fishing gear will be found in Buchanan Hamilton's treatise, parts of which have been reproduced in this volume as an appendix. His description of fishing gear and fishing boats still holds good in every respect today in West Dinajpur.

Weaving—Weaving is still regarded as one of the principal industries, though the number of professional weavers are now very small and few of them are entirely dependent on weaving for a means of livelihood.

The census of 1951 reported only 116 persons as following cotton spinning, sizing and weaving as their principal means of livelihood. An account of coarse cloth (*phota*) of jute and cotton mixed, is manufactured for home use by Rajbansi women all over the district.

Mats and baskets—The mats and baskets in general use all over the district are mostly made by Doms, though a few Santals employ their leisure in this sort of work. The matting used for walls, ceilings, and floors of houses, compound fences, boat roofs and cart covers is made of lengths of split bamboo, woven cross-wise, and is both cheap and serviceable. It is called *chātāi*. Baskets also are generally made of split bamboo, though cane is sometimes em-

ployed for finer work. These baskets are of many kinds and play an important part in the daily life and domestic economy of the people. Different kinds of baskets are used for carrying earth or manure, provisions, fruit and vegetables, washing rice, and many other purposes. The finest examples of the work of Doms are the large closely woven baskets used for storing grain, and the hemispherical baskets of different sizes, called *dons*, universally used as grain measures. Small stools (*morā*) and cart covers (*chhai*) of matting and bamboo are also made by these people.

MEANS OF COMMUNICATION

There is reason to believe that in the days of Muhammadan rule the present limits of the district were well provided with roads. One of these roads ran from Dum Duma or Ganga-rampur to Ghoraghat, thus connecting two important military stations. It is said to have a fine road in its day and to have formed the basis of the present District Board road from Gangarampur to Ghoraghat *via* Patirampur and Hili. Another road joined Pandua with Gangarampur *via* Bansihari, and still another Pandua with Ekdala-Bahirhata. A fourth road went along an embankment from Pandua to Raiganj along what has been described before as the Mukdam Band. In Major Rennell's map and in his list of roads in Bengal and Bihar, published in 1777 and 1781, respectively, a large number of roads is shown as leading from Dinajpur town to various places. The rivers also provided excellent means of transport as even now their banks are studded with big bazars and markets. Between Rennell and Buchanan Hamilton's time and the Revenue Survey of 1861-3 the roads of the district deteriorated. Major Sherwill, writing in 1863, observed "the district is not famous for good roads". The principal thoroughfares now are two both recently renovated. In 1947 the partition of the district left the present district's roads and means of communication grievously cut in all directions. The use of the Punarbhaba, Atrai and Jamuna was suddenly and entirely stopped, these rivers flowing through Pakistan territory for the rest of their southward passage. The Gangarampur-Hili Road stopped at Hili and the Gangarampur-Raiganj Road little used formerly was in a bad state of repair. Before the Partition there was little occasion to use the Malda-Gajol-Bansihari-Balurghat road. After the Partition this road became the lifeline of the district. The Katihar-Raiganj-Radhikapur-Dinajpur-Parbatipur metre gauge line was cut by the partition line at Radhikapur. The use of the Eastern Bengal Railway was denied altogether because while the town of Hili remained within the district, the precincts of the railway station fell to the share of East Bengal. Thus in 1947, after the Partition, the district started its career

with a most lamentable disorganisation of communication. To add insult to injury there was no District Board at all and naturally no adequate funds for taking up the maintenance of District Board roads. An *ad hoc* District Board was formed with the rump of the District Board left over by the Partition and other nominations, to which an *ad hoc* sum of money was granted by the Government to carry on. The only link of good road that existed in 1947 in the district was the Balurghat-Hili road which was metalled and macadamised. It is in this sphere that the Government stepped in and acted with boldness, imagination and swiftness. In 1948, barring the 16 miles of Balurghat-Hili road, there was not a furlong of good modern road in the district. But between 1948 and 1952 the Government succeeded in building a very fine network of trunk roads. The Khejuriaghat-Malda-Gajol road striking through the middle of the district of Malda was extended beyond Gajol to Bansihari, Patiram and Balurghat with a branch from Bansihari connecting Kaliaganj. Another modern highway struck out from Kaliaganj to Raiganj. This tuning fork of a road system with its two prongs, Bansihari-Gajol and Bansihari-Raiganj-Kaliaganj, completed a great trunk road from end to end of the two hitherto neglected districts of Malda and West Dinajpur, and opened up a vast agricultural tract, which produces much agricultural wealth and valuable fruit, the value of which it has not been possible fully to assess owing to the high freight charges unavoidable in a well-nigh inaccessible region. The Bansihari-Kaliaganj-Raiganj branch connects the important centres of trade in West Dinajpur district itself; which are Balurghat, Patiram, Kumarganj, Gangarampur, Kaliaganj and Raiganj.

There are other roads which are being taken up for improvement which are the Balurghat-Tapan-Gagarampur Road; the Patiram-Samjia Road; the Raiganj-Churamanghat Road.

On account of the Partition the only bit of railway line left in the district is the metre gauge line from Katihar to Radhikapur with intermediate stations at Raiganj, Bangalbari and Kaliaganj.

Since 1949 a good airlanding strip has been developed at a point two miles north of Balurghat town. This is now a non-scheduled (1952) all weather landing ground for Dakotas and smaller craft and has proved invaluable not only for the maintenance of normal amenities of the district but also to the jute trade.

LAND TENURES

An account of the land tenures of the district will be available in Buchanan Hamilton's survey published as an appendix in this volume.

Buchanan Hamilton also gives a very valuable account of the changes that land tenures in the district underwent between 1793 and 1808. Apart from revenue-paying estates, revenue-free estates and resumed estates, the following systems of land tenure still obtain in the district.

Istimirari taluks—(1) Istimirari or Mukarrari taluks—These are those which were created by the zemindars or others having a proprietary right in the soil, before the Permanent Settlement of Lord Cornwallis in 1793. They were granted to the lessees, their heirs and successors, in perpetuity, at a fixed rate of rent. The holders of these tenures can transfer or sublet their taluks in *patni*, *ijara* or otherwise. The tenures are liable to sale only for arrears of rent, and by a decree of the Civil Court, under the provisions of Act VIII of 1869. In the case of the sale of the parent estate under Act XI of 1859, for arrears of Government revenue, the holders of istimirari taluks are protected from ejectment or enhancement of rent on the part of the auction purchaser.

Patni taluks—(2) This tenure had its origin on the estates of the Maharaja of Burdwan, but has since become common throughout Bengal. It is a tenure created by the zemindar to be held by the lessee and his heirs for ever, at a rent fixed in perpetuity. A *salami* or present, equal in value to from 3 to 5 times the annual rent, is paid by the lessee to the zemindar on the creation of the grant. The grant once made, the zemindar is divested of connection with the property, the patnidar acquiring every right of proprietorship which the zemindar possessed. On failure to pay the rent, however, the zemindar has power to sell the tenure under the provisions of Regulation VII of 1819. A patnidar has the power of subletting his tenure, the sub-tenant acquiring the same rights as the patnidar himself possesses from the zemindar. A patni when sublet becomes a *dar-patni*; a *dar-patni* when sublet becomes a *se-patni*. Arrears of rent from these sub-tenures are recoverable under Act VIII of 1869.

Ijaras—(3) An *ijaras* is a temporary lease or farm. The ijaradar has no permanent interest in the estate, and his sole object is to make as much as possible out of the cultivators during the term of the lease. He is, however, debarred from ousting the tenants, or from enhancing their rents. In some cases a zemindar makes over his estate in *ijara* to a person to whom he owes money, in order to liquidate the debt. These latter are called *dai-sud-ijaras*. Ijaras are generally granted for a term of 4 or 5 years, sometimes for 8 or 10 years, but very seldom for a longer period than 20 years. A zemindar cannot oust an ijaradar, except by a decree of the civil court for arrears of rent under Act VIII of 1869. In the event

of the sale of the estate for arrears of Government revenue, the purchaser can oust the ijaradar, except in the case of an *ijara* granted for a term of 20 years or upwards and duly registered under the provisions of Act XI of 1859. An *ijara* is sometimes sublet, and becomes a *dar-ijara*, the term, of course, being limited by that of the *ijara* itself. The *dar-ijaradar* enjoys all the rights and privileges of the ijaradar. The term *taluk* is not nowadays used in connection with *istimirari* tenures which are called simply *istimirars*. *Ijāras* are generally spoken of as *ijārā mahāls*.

Cultivating tenures or jotes—Next come the cultivating tenures or *jotes*, which are thus described by Hunter:—“(1) *Maurusi* jots are holdings created by a zamindar, to be held by cultivators in perpetuity at a fixed rate of rent. These tenures are transferable, and the purchaser acquires all the rights and privileges of the original holder. (2) Istimirari jots are cultivators' holdings, the rents of which have not been altered for a period of 20 years, and the owners of which have thus acquired the right of holding them free from liability to enhancement. These tenures, like the foregoing, are saleable by the holders. (3) Jots of cultivators with occupancy right are holdings of at least 12 years' standing. The owners of these jots cannot be ejected, but the rent can be enhanced by a suit in the civil court. (4) Jots of tenants-at-will are the holdings of cultivators who do not possess a right of occupancy and are liable to ejectment and the payment of enhanced rents. (5) Nij-jots are the home-farms of the zamindars.” He also describes some other kinds of holdings, which are now no longer in existence.

Rent-free tenures and holdings—*Lākhirāj* or rent-free tenures are of several kinds, viz., *Brahmattar*, *Debattar* and *Pirpāl*. The meaning of these terms has already been described in connection with revenue-free estates. The distinction between them and these latter is that whereas revenue-free estates pay no revenue to Government, the revenue payable on rent-free tenures is charged to the parent estates of which they originally formed a part. *Chākrāni* lands are holdings granted in return for services rendered to the zemindar, and are liable to be resumed by him when the services of the holders are no longer required. Rent-free tenures and holdings generally are exempt from all payments to the zemindar. Except in the case of *Chākrāni* lands, most of the present holders are purchasers from the original grantees or their descendants.

The holders of cultivating tenures are known as *rai-yats* or in local parlance *jotedārs*. There is often little to distinguish them from under-tenure-holders cultivating their own lands, ex-

cept that the latter have the privilege, which ordinary *jotedārs* do not possess, of subletting their lands to tenants at fixed rates.

Besides the above there are two classes of cultivators who occupy land under the holders of cultivating *jotes*. These are *chukanidārs* or under-*rayats*, who are allowed to occupy a piece of land for a specified term, generally one or two years, on payment of a stated sum as rent, the sum being fixed without reference to the quantity of land occupied, and *ādhiārs*, persons who cultivate a *rayat's* land, and in return for their labour, and for supplying the necessary plough bullocks and agricultural implements, receive a half share of the produce. Neither of the above classes have any rights in the land they cultivate. The land occupied by a *chukānidār* is called *thikā* land. A large number of the smaller holders of cultivating *jotes* in the district stand also in the position of *chukānidārs* or *ādhiārs* to other *jotedārs*.

EDUCATION

The statistics of educational institutions published in the statistical section of this volume

give a picture of the state of education in the district. The district lost its major seats of learning with the Partition of the State in 1947. The district School Board looking after the primary education of the district started a fresh career in 1947 and so did the District Board. Balurghat and Raiganj were created municipalities in 1951, and as such, they have not been able to do much by way of municipal education. The High School of Balurghat is an old institution. There is an old school at Churaman in Raiganj subdivision. Two colleges have been opened after the Partition. The Balurghat College was started in September 1948 as an Intermediate Arts College. It was affiliated to I.Sc. in 1950. In 1953 it has a roll strength of about 250. It received aid from the Government. The Raiganj College was started in August 1948 and received in 1950 a grant of Rs. 44,000/- from the Government under the Refugee Dispersal Scheme. It has its own building and a roll strength of about 130. It was affiliated to I.A. in 1948-9 and is now expecting affiliation in I.Sc. Both Colleges have to be helped by the Government as the income cannot meet the expenditure.

APPENDIX I

GAZETTEER

Balurghat—Headquarters town of the district and of the subdivision of the same name, situated in 25° 13' N. and 88° 47' E., on the banks of the Atrai river, containing a population of 18,121. It contains the district offices, civil and criminal courts, a registration office, a college and a high school. The latter is a promising institution. There is a large and well found hospital-dispensary started principally by private subscriptions, the local zemindar, the late Rajendra Nath Sanyal, being a liberal subscriber. There is little worth describing in the town of Balurghat itself. It is a very ordinary town in appearance, though, being situated on the high banks of a fairly large river, it is well drained and healthier than many of the places in the district. The view from both banks of the river is picturesque enough especially in the rains. The nearest railhead is Kalganj, about 60 miles due north-west. The Balurghat airport is about two miles north of the town.

Balurghat Subdivision—The Sadar subdivision of the district, lying between 25° 10' and 25° 32' N., and 88° 23' and 89° 01' E., with an area of 585.6 sq. miles. It contains a population of 328,114, the density being 560 per sq. mile. The number of villages is 1,048. The subdivision is divided for administrative purposes into five police stations, *viz.*, Hili, Balurghat, Kumarganj, Tapan and Gangarampur. It was formed in 1947.

Bansihari—Headquarters of the police station of its name, 39 miles west of Balurghat and forms the important trijunction of the Malda-Balurghat road and the Bansihari-Kusmandi-Kalganj-Raiganj road. There are public offices in this police station. There are many ancient sites within the thana which extends over an area of 134.2 sq. miles. At Bansihari near the bridge over the Tangan old curved stones have been salvaged and preserved on the western bank. Similarly at Andharmanik (J.L. 267) on the Malda-Bansihari road where the latter crosses the Bahakhari, the ferry point is known as Patharghata which contains remains of an old stone temple. Names such as Bara Kusba, Kismat Kusba, Arajai Hujuri Kusba, on either side of the Malda-Balurghat road, near the border of Malda district adjacent to Deotala in Malda are suggestive of a string of Muslim forts. The name Habili (J.L. 192) very near Andharmanik close to the Malda-Bansihari road is also suggestive. The road which takes off from Malam (J.L. 200), two and a quarter miles south west of Bansihari, from the Malda-Bansihari road and goes north, and then west to Mahandighi and Altadighi to the north-western corner of the thana is an old brick paved road and still contains the remains of an old bridge. There is an interesting old mosque at Gopalpur (J.L. 123) about 4 miles north of Malam where the road bends to the west. Gourdigghi at Bairahata (J.L. 5) is an ancient Hindu tank while Maliandighi (J.L. 112) and Altadighi (in J.L. 4) are celebrated Muslim tanks. Kusba (J.L. 108), Bairahata (J.L. 5) and Ekdala Bahirhata now in Kusmandi police station contain the ruins of the seats of Muslim power in the 15th and 16th centuries. The country all around is strewn with the ruins of old buildings. In the north east Elahabad (J.L. 230) and Sihai, the former about 6 miles to the north east of Bansihari police station and the latter 7 miles to the north east of Bansihari on the Bansihari-Muhpaldighi road are ancient villages, once famous in history.

Ohuraman—A big village on the Mahananda on the south-western border of the district, in the jurisdiction of the Itahar thana. It is 14 miles from Raiganj railway station. It is a considerable grain mart, the paddy and other produce grown in the surrounding country being exported in boats down the

Mahananda. The Churaman zemindars, an old family with considerable estates in the neighbourhood, have their home here and their family residence about 7 miles from Raiganj is a large and commodious, red building with extensive grounds. There is a Government dispensary close to the house and boys' and girls' schools.

Gangarampur—Village in the Balurghat subdivision on the east bank of the Punarbhaba river. It is situated on a main road 32 miles west from Balurghat town and is the headquarters of a police station 127 square miles in extent. There are several interesting places in the neighbourhood. Within a mile of the village there is a splendid old tank, called Dhal-dighi, dating from Muhammadan times, where the largest cattle fair in the district is held. This fair is a very old one, but of recent years its importance has declined, owing to the competition of other fairs which have come into existence in the vicinity. In Muhammadan times Gangarampur was called Dandama and was a frontier military post. The commander of the troops, called the Wazir, is said to have lived on the banks of the Dhal-dighi tank which was probably excavated by the Muhammadans, as its lie from east to west seems to indicate. In later times under British rule Dandama was the seat of a Munsif as well as of a Daroga. A little above Gangarampur on the east bank of the Punarbhaba are the extensive ruins of Bannagar, the city of Ban Raja, a mythical Hindu monarch a devotee of Shiva, who fought with Krishna, and is said to have been ultimately overthrown by an infidel race from the west, possibly identical with Alexander's Greeks. The site of this ancient city appears to have originally contained the remains of many stone temples and other buildings of massive architecture, but for centuries now the ruins have served as a quarry for builders all over the district, and four pillars of coarse granite and a slab or two of sandstone, which form part of a ruined mosque but clearly have a much earlier origin, are all that is left of its ancient grandeur. Other portions of the mosque are of brick and indeed the whole site of the city is so thickly strewn with bricks that it is clear that a great number of brick buildings must have stood there at one time. I think it probable that most of these bricks date merely from Muhammadan times, and are the remains of the lines in which the troops were quartered. The University of Calcutta in 1937-8 undertook the excavation of Bargari and brought out a report in 1948. Some of the objects salvaged are preserved in the Asutosh Museum of Calcutta University and some are with a local club *Prachya Bharati* at Balurghat. Tradition attributes the Tapandighi in police station Tapan is a fine tank more nearly resembling a lake, which is situated 8 miles south of Gangarampur, to Ban Raja and near it are many remains connected with his name. Another interesting old tank situated in the Gangarampur jurisdiction is the Kaldighi lying a little to the east of Dhal-dighi. This tank is attributed to Kala Rani, queen of Ban Raja. Two miles south of Gangarampur is Nayabazar (Mauza Gopalpur) a large grain mart on the banks of the Punarbhaba, from which a considerable export of paddy is carried on by river.

Hemtabad—Headquarters of a police station of its name in Raiganj subdivision, covering an area of 74 sq. miles. A full account of Hemtabad will be available in Buchanan Hamilton's description of the division of Hemtabad published elsewhere in this volume as an appendix. The description holds good to this day. Hemtabad is 4 miles north of Bangalburi Railway station on the Katihar-Radhikapur Railway line.

Hili—A town at the eastern extremity of the district, which used to be a very important rice centre

APPENDIX I—contd.

before the Partition of 1947, having been on the Bengal and Assam Railway Line. The denial of the railway line after the Partition has diminished the importance of the town. Before 1947 Hili used to have 16 to 18 rice mills but since 1950 quite a number of them have been dismantled and re-established in places like Kardaha, Bansihari, Kaliaganj and Raiganj. Hili also used to be an inland port called Hili Bandar on the left bank of the Jamuna river. The boat traffic has also died away on account of the Partition.

Itahar—The south-westernmost thana of Raiganj subdivision 165 sq. miles in extent. Itahar the headquarters of the police station is situated almost in the centre of the police station. In this police station too there are many ancient sites, one of which is Churaman (J.L. 164) which is about 7 miles south by west of Itahar. Such names as Subarnapur (J.L. 165), on the Mahananda and Indran (J.L. 16) on the Su river and Anritakhanda, Rudrakhand, Brahmakhanda on the boundary of Itahar in Raiganj police station are very suggestive of ancient settlements.

Kaliaganj—The headquarters of a police station in Raiganj subdivision, the police station covering an area of 120.3 sq. miles. Kaliaganj is now the most important railway centre in West Dinajpur district, the other two being Raiganj and Radhikapur. The distance from Kaliaganj to Balurghat by road is about 60 miles. Having acquired importance after 1947 as a railhead and the central point on the road connecting Raiganj with Balurghat the police station has flourished beyond measure and the more important rice mills of the district are now located in Kaliaganj.

Kardaha—Traditionally Kardaha is the place where Krishna cut off the 998 hands of Bana Raja and burnt them. Kardaha forms one of the important zemindari kutcheries of the Dinajpur Raj and has several ruins and temples. It is now an important grain mart. It is situated about 7 miles west of Tapan police station on the east bank of the Punarbhaba, about 8 miles south of Gangarampur.

Kumarganj—Headquarters of a police station in Sadar subdivision north of Balurghat police station. The thana is 110.8 sq. miles in extent and used to form an important inland port on the Atrai, midway between Dinajpur and Balurghat on the Dinajpur-Balurghat road.

Kusmandi—Headquarters of a police station in Raiganj subdivision. The extent of the thana is 120 sq. miles. The police station is about midway between Kaliaganj and Bansihari on the Kaliaganj-Bansihari road. This police station is also studded with many ancient sites. There is a raised ridge running across a great length of the thana, which is known as the Ushaharan road, over which Aniruddha son of Krishna is supposed to have eloped with Usha, daughter to Ban Raja. About seven and half miles east of Kusmandi is the celebrated Mahipaldighi (J.L. 190) and about two miles further east of Mahipaldighi is Panchapagar (J.L. 217) the ancient site of Panchanagari mentioned as unidentified in the History of Bengal Vol. 1 by R. C. Mazumdar. Ekdala (J.L. 197) is adjacent to Sihai of Bansihari and about 2 miles to the north of Elahabad mentioned before. This Ekdala is also an ancient site. At the western corner of Kusmandi there is Ekdala Bahirhata (J.L. 39). The thana is served by several roads all of which can be negotiated by jeep in February.

Mahipaldighi—This is a large tank by the side of the Malda-Dinajpur town road about $7\frac{1}{2}$ miles east of Kusmandi in the thana headquarters of Kusmandi. It is thus described by Buchanan Hamilton:—"In the north-east part of this division is a very large tank, supposed to have been dug by Mohipal Raja, and called after his name. The sheet of water extends

3800 feet from north to south, and 1100 feet from east to west. Its depth must be very considerable, as the banks are very large. On the banks are several small places of worship, both Hindu and Moslem, but none of any consequence; nothing remains to show that Mohipal ever resided either at the tank or at Mohipur, near it; but there is a vast number of bricks, and some stones, that probably belonged to religious buildings, that have been erected by the person who constructed the tank. One of the stones is evidently the lintel of a door, and of the same style as those at Bannagar, and may have been brought from the ruins of that city. The people in the neighbourhood have an idea that there has been a building in the centre of the tank; but this is probably devoid of truth, as there is no end to the idle stories which they relate concerning the tank and Mohipal. Both are considered as venerable or rather awful, and the Raja is frequently invoked in times of danger." In 1793 a branch factory of a larger indigo concern in Malda was erected at Mahipaldighi by a Mr. Thomas, who combined the functions of indigo planter and Baptist Missionary. The remains of the old indigo vats are still to be seen on the north bank of the tank. It does not appear that the factory was ever very large or prosperous, or that Mr. Thomas had any great success with his mission work in that neighbourhood. It is said that Mr. Thomas utilised some of the old bricks and stones, spoken of by Buchanan Hamilton, in erecting his factory buildings. It was here that William Carey the missionary, linguist, and horticulturist, first set up his mission and perhaps his first printing press, in the first year of nineteenth century. The tank with its lofty embankments covered with well grown trees, and its great expanse of water fringed with tall feathery-topped reeds, is one of the most beautiful spots in the district, and something of grandeur and mystery still clings to it. A remarkable thing about this tank is that fish of the carp family caught in it are so tough and oily as to be quite uneatable. The flesh indeed is said to resemble rubber in consistency.

Narai—This is a village in Gangarampur thana (J.L. 102) about 4 miles east of Gangarampur police station on the Gangarampur-Balurghat road and about 2 miles north-west of the junction of the old Dinajpur-Murshidabad road. There are ruins of as many as 8 tombs said to be those of old Mughal generals, who during their Assam expeditions fell victims to fever or epidemic.

Raiganj—Headquarters of the Raiganj subdivision about 80 miles west of Balurghat. It is the centre of a police station 186.4 sq. miles and is also a railway station. Raiganj is, next to Balurghat, the largest and most important centre in the district. The population at the last census was returned as 15,473. The greater part of the town and surrounding country used to be owned by the Maharaja of Dinajpur, who has a large *kachhahri* there, and who founded the charitable dispensary. He derives a considerable profit from the market, in which fish is an important commodity. The Churaman zemindars also have valuable property in the town. A considerable trade is carried on in jute and oil-seeds, and, besides many jute godowns belonging to native merchants, the large Greek firm of Rally Brothers had a jute press near the railway station. The river Kulik runs through the town and there is a brisk trade by boat during the rains. Kasba Mahaso (J.L. 176) barely a mile west of Hemtabad and Chhoto Parua (J.L. 184), about 3 miles south west of Kasba Mahaso on the Kaliaganj-Raiganj road, in which can be seen the remains of Badsah-ka-takht, are now in Raiganj police station.

Raiganj Subdivision—The western subdivision of the district lying between $25^{\circ} 15'$ and $25^{\circ} 50'$ north latitude and $88^{\circ} 02'$ and $88^{\circ} 23'$ east longitude. The

APPENDIX I—concl'd.

subdivision, created in 1947 extends over an area of 800 sq. miles, has a population of 392,459 and consists of the police stations—Bansihari, Kusmandi, Kaliaganj, Hemtabad, Raiganj and Itahar. The headquarters of the subdivision is at Raiganj on the Kulik river. Part of the former Katihar-Parbatipur line runs through this subdivision which has four railway stations—Raiganj, Bangalbari, Kaliaganj and Radhikapur. Beyond Radhikapur the railway line enters East Bengal. This subdivision is one of the most important centres of jute in North Bengal, the land being fertile and containing much *pali* soil. It is now opened up by two important highways. The highway Balurghat-Bansihari-Kusmandi-Kaliaganj-Hemtabad-Raiganj is expected to join National Highway No. 31 or the Bihar-Assam road while the Malda-Bansihari highway has opened up the south. Within this subdivision the Raiganj-Itahar-Churaman road, the Raiganj-Bindol road, the ancient Raiganj-Itahar-Pandua road part of which is called the Makdam band, the Pandua-Gazol-Dehubanda-Raghumathpur-Kaliaganj road, the Bansihari-Birol road are all remains of a fine net-work of roads connecting important sections of this subdivision.

Santosh or Mahisantoshgarh (J.L. 71 Santosh Palashdanga). About 5 miles due west of Balurghat. There are ruins of an extensive *Garh* or Fort in this place, with a tank to the south of the fort. There are also ruins of a large house to the south of this tank, supposed to be the Assembly Hall of a Hindu ruler. There is a *Darga* in front of the garh where there are 2 Muslim graves one beside the other.

Tapan—Headquarters of the police station of its name in Sadar subdivision, the area of the police station being 170.3 sq. miles. This must be a very ancient place. There is a large tank called Tapandighi which is the biggest sheet of artificial water in the district. Tradition says that it is the tank at which Ban Raja used to offer his *tarpan*. There are ruins of 2 Muslim forts at Kasba (J.L. 64) and Kasba Madhabpur (J.L. 65), while there are large mounds suggesting buried structures at Dwipkhanda (J.L. 140) barely 2 miles to the east. Tapan is on the junction of the Kardaha-Balurghat road with the Gangarampur-Porsha road.

APPENDIX II

An Account of Land Management in the District of West Dinajpur, 1870-1952

The figures related in Sections I to IV all refer to undivided Dinajpur district.

The present area of Dinajpur district after recent transfers is returned by the Boundary Commission at 4,095.14 square miles or 2,620,889 acres. In 1870 the Collector estimated that 2,032,287 acres were actually under cultivation, namely 1,016,148 acres under rice, 201,801 under jute and 841,338 acres under other crops.

Generally speaking a cultivator's entire holding is under rice, with the exception of a small patch around the homestead on which he raises crops of vegetables.

No improvement seems to have taken place in the quality of rice grown in Dinajpur; but the Collector reports that a great deal of marsh land, formerly waste, has been brought under rice cultivation within the last 25 years. The soil appears to have decreased in productive power by over-cropping; it is said that the land now produces less by one-fifth than what it did 25 years ago.

Sugarcane cultivation appears to have declined in Dinajpur district; and on this subject I extract the following remarks from the Revenue Surveyor's (Major Sherwill) report: "In former years the cultivation of sugarcane was carried to a much greater extent than it is now in Dinajpur. Various reasons are assigned for its decline. Among others it is asserted that the land has become less favourable to its growth since the waters of the old Tista have left this part of the country. However this may be, the deterioration of the cane is unquestionable."

At harvest and seed time gangs of labourers come to Dinajpur from Purnea and other districts for field work, and are paid in money either by the day or month. Many permanent labourers are employed on the holdings of larger agriculturists; they are paid a small money wage in addition to their food, but never by a share of the crop. Many husbandmen who have a larger holding which they can cultivate with their own hands instead of employing hired labour for the purpose, make over the land on a *metayer* tenant to another person to cultivate. The landlord advances the seed, the tenant finding labour, oxen and implements. At harvest time after the crop has been gathered in, the seed grain originally advanced is repaid, and the balance shared equally between the proprietor and the cultivator. Occasionally the kind are provided by the landlord who in this case receives a larger share of the crop than if the cultivator had to find them. Occasionally also it happens that the landlord makes a money advance as well, but such instances are extremely rare. Women and children are largely employed for field work.

Of the total surplus rice of Dinajpur it is roughly estimated that one-half is exported to the north-western provinces by way of the Tungan, Kulik, Purnabhanga and other streams into the Mahananda and so into the Ganges; and that the remaining half is exported southwards. Most of the exports to Calcutta come by way of Atrai into the Mathabhanga. A little also finds its way down the Mahananda and on to Calcutta by way of the Jalangi route. The traffic on the Atrai river to Calcutta goes almost entirely down the Mathabhanga till the middle of October; after which if the Mathabhanga gets dry it goes round by the Sundarbans or by way of the E. B. Railway. In 1872, 844,424 maunds or 30,822 tons, in 1873, 789,420 maunds or 28,898 tons of rice were exported. The whole of this, however, is not Dinajpur produce. A great deal of the rice of

the west and south-west of Rangpur district is collected at the Dinajpur marts on the Atrai and Karatoya and so sent to Calcutta. Of the marts Patiram, Kumarganj, Chandganj, Kaliaganj, Chak Gopal, Fakirganj, Rangamati, Paglibandar, Samjia, Brahmapur and Balurghat are all on the Atrai river and in Dinajpur district. All these marts are in close proximity to each other.

Yield per acre—A good average yield from land paying a rent of Rs. 1/8- per bigha or 9s/- an acre is stated by the Collector to be from 8 to 10 mds. of paddy per bigha or 17½ to 22 cwt. per acre. Exceptionally good land which pays as high as Rs 3/- per bigha or 18s/- per acre, should yield 16 to 17 maunds of paddy per bigha or from 35 to 37 cwt. per acre. Upon some lands a second crop of pulses or oilseeds is grown. *Khar* land produces only one rice crop in the year. But *pah* land produces the *aus* or autumn rice together with a cold weather crop of pulses or oilseeds. The Collector considers that a good return from land yielding both crops and paying a rental of Rs. 1/8/- a bigha or 9s/- an acre would be 9½ to 12 maunds of produce per bigha equivalent to from 20 to 26 cwt. per acre; and from land at Rs. 3/- per bigha or 18s/- an acre 18 to 20 maunds of produce per bigha equivalent to from 39 to 44 cwt. per acre. These estimates are based on the standard bigha of 14,400 square feet.

Average land per agricultural family—A farm of 5 ploughs or about 25 acres in extent is considered a large holding for a peasant; but some of them cultivate as much as 12 ploughs or 60 acres. Three ploughs or 15 acres is considered a comfortable holding; and indeed a cultivator could maintain a small family from a single plough of five acres of land, although he would not be so well off as a respectable retail shopkeeper. As a class the husbandmen are generally in debt. The land is chiefly held by tenants at will; the proportion of cultivators with occupancy rights in the soil does not, in the opinion of the Collector, exceed one in every five of the general body of cultivators. There are very few husbandmen indeed who hold their lands under a right of occupancy, and who are at the same time exempt from enhancement of rent. No class of small proprietors exists in Dinajpur district who own, occupy and cultivate their hereditary lands themselves, without either a zamindar or superior landlord of any sort above them, or a sub-tenant or labourer of any sort below them.

Rice constitutes the staple crop throughout the district. Of the total food supply the *aman* or winter crop grown on low lands and usually transplanted furnishes from 80 to 96 per cent. The *aus* or autumn crop grown on high lands, about 17 per cent; the *boro* or spring crop grown on the borders of marshes and rivers in certain tracts supplies from 4 to 8 per cent. This last is the only crop in the district which demands irrigation and the water required is easily obtained from the immediate neighbourhood. Though the area of rice cultivation has widely extended in recent years, it is said that the productive powers of the soil have decreased owing to over-cropping. Among miscellaneous crops may be mentioned maize and millet, pulses, oilseeds, tobacco, jute, sugarcane, *pan*. The staples grown for export are rice, jute and tobacco. The cultivation of sugarcane is on the decline.

Khar land is never allowed to lie fallow. But *pah* requires an occasional rest of about one year in every five. The principle of the rotation of crops is not

APPENDIX II—contd.

known. There is still a good deal of spare land capable of cultivation, to be found in the south of the district.

There is little peculiarity in the land tenures of Dinajpur. It is estimated that over five-eighths of the total area of the district the superior landlords have parted with their rights in favour of any other *metayar* tenure holders. Only a small fraction of the cultivators have won these rights of occupancy of continuous holding of more than 12 years. The great majority are mere tenants at will.

Yield per acre—The average produce of an acre of good rice land renting at 9s/- is about 20 cwt. of rice. Exceptionally good lands will sometimes yield as much as 37 cwt. per acre.

III 1903-04—Not available.

The following is a statement of land employment in IV District the district:—
Gazetteer, 1912

Description	Area
Area of the district	3,946 sq. miles.
Area under rice	998,700 acres or 79·6 per cent. of the net cropped area
Aman rice	68·7 per cent. of the net cropped area
Aus or autumn rice	10 per cent. of the net cropped area
Boro rice	Very small area
Jute	92,000 acres
Rape and mustard	90,000 acres
Sugarcane	25,000 acres
Tobacco	9,800 acres
Area not available for cultivation (rivers, beels, and private sal forests)	500,000 acres
Culturable waste, other than fallows	237,030 acres
Current fallows	505,080 acres

A little less than half the area of the district is cultivated. It is thus apparent that there is still considerable room for expansion of cultivation. Rice is still by far the most important crop, notwithstanding the rise in importance of jute in recent years. The principal crops are winter rice, autumn rice, jute and rape and mustard.

In the northern half of the district the soil is light ash coloured sandy loam changing gradually as one proceeds south to a stiff clay of similar colour. The former goes by the name of *Pali*, is very retentive of moisture and is capable of producing two crops; the latter is known as *Khior* and ordinarily bears not a single crop. In the southern or *khior* area isolated patches of laterite soil are to be found here and there, especially on both sides of some of the larger rivers like the Atrai. Nowadays the beds of most of the rivers are deep and wide and the deposit of sand or silt by floods is no longer a factor to be reckoned with seriously over the greater part of the district. In the lower reaches of the Nagar, Purnabhaha and Mahananda

owing to the lowness of the river banks floods are of yearly occurrence and large stretches of country are on this account given up to jungle or bear only occasionally crops of *boro* or spring rice, which is reaped just before rivers rise. Common rotations are autumn rice followed by mustard and jute followed by winter rice or pulse. In the extreme south of the district the Barind makes its appearance. The higher ground in this tract is generally barren and little attempt is made to cultivate it, though with time and determination this can be done successfully. The low ground is a stiff clay of reddish colour and is excellent winter rice land, though like the *Khior* area it does not lend itself to the cultivation of any other crop.

There are at the present day no embankments of any importance in the district though some traces of earlier works of this nature may be seen here and there. The most noticeable of these is a long straight embankment called *mokdam bund* running from Gajol in Malka to Ruganj. This embankment dates from Mohammedan times. Its object was partly to keep out water from the Nagar river which almost annually overflows its banks, and renders many thousands of acres unculturable, and partly to serve as a highway to the low-lying country on the south-western border.

Yield per acre: Not available.

Average land per agricultural family—The average size of holding in possession of several classes of cultivators is as follows:—

General average	3·10 acres
Raiyats at fixed rates of rents	7·29 "
Settled raiyats	3·15 "
Occupancy	2·54 "
Non-occupancy	2·30 "
Under-raiyats	·26 "

An accurate estimate of the rate at which cultivation in the district has extended is impossible, as the cultivated area has never been properly ascertained. The Revenue Survey of 1861-63 took no account of cultivated area, and the figures given in the annual reports are more or less guess-work. It is probable that between the beginning of the last century and the time of the Revenue Survey there was little progress made in this direction, as the Revenue Surveyor speaks of large tracts being covered with dense trees and grass jungle, infested with wild animals. After the famine of 1873-74 price of food-grains began to rise and agriculture at once began to assume a more attractive aspect. As the local cultivators were ill-suited to the hard work involved in clearing heavy jungle, the Manager of the leased estate made the experiment of importing Santhals from the Santhal Parganas. The experiment was attempted with such seriousness that many zemindars imitated his example and since then these settlers have been migrating into the districts in ever increasing numbers, with the result that this extensive jungle tract has to a great extent been brought under cultivation, and the cultivated area of the district has been increased by about one-third. It must not be supposed that these Santhal settlers retained possession of all the jungle lands that they had acquired. The general practice is for the zemindar to settle the lands to be cleared with them for a period of years at a very low rate. At the expiry of the period, the land having been brought under cultivation and having greatly gone up in value in consequence, the rent is raised to the level of that of similar lands in the neighbourhood, whereupon the Santhals promptly move on to some other spot where uncultivated waste lands are to be had. While the native Bengalee cultivators take their place.

There has up to date been little or no advance in the

APPENDIX II—contd.

direction of improvement in agricultural practice. The only agricultural improvement if such it can be called which has really succeeded in the district, is the substitution of the iron sugarcane mill for the primitive wooden machine, with the result that a larger percentage of juice than before is obtained from the canes.

In the settlement the difference between culturable and unculturable fallow or jungle were sometimes artificial, and the ideas of members of the staff might vary. The term "culturable fallow" was rarely used, and big stretches of grass land or *maidan* which had never been ploughed or had been fallow for over three years appear in the statement below under "old fallow" (culturable but not cultivated). The net result is that of the land classed as "Culturable other than current fallow" that under bamboos, thatching grass and sal woods totalling some 92,000 acres in all is not really available for cultivation for it is already producing articles which are valuable, or indeed, as bamboos, indispensable for the agricultural community. Even the old fallow and perhaps the culturable jungle hardly can be regarded as available for further cultivation and this includes high arid *maidans* and heaths, the poorest land in the district.

It is significant that Dinajpur, with its scanty population, has as large a proportion of its area under crop, as neighbouring districts with a much denser population. Indeed if land area alone is considered a greater proportion of the Dinajpur district is cropped than of the Malda district. The Dinajpur figure is 77.7 per cent. against 73.3 per cent. for Malda. The explanation is that those other districts have a far higher proportion of two-cropped land and possibly that crop yields are lower in Dinajpur than in some other districts. Actually the Malda and Rangpur Settlement Reports both give estimates of paddy and jute yields which are not very different from those obtained from Dinajpur. So the explanation of low yields may not hold, but in addition to the land of double-cropping one may suggest the absence of subsidiary sources of income and the absence of valuable cash crops, grown in Rangpur as the reason for high proportion of sown area and low population. Agriculture in fact in Dinajpur is extensive and not intensive. Only 9½ per cent. of the net cropped area is *dofashi*, twice-cropped, against 27.3 per cent. in Malda and 41 per cent. in Rangpur. Only the paddy growing districts of the south and west, such as Birbhum, 24-Parganas and Khulna have less.

No study of the economic condition of the agriculturists of the district would be complete without mention of the *adhi* system or half-share cultivation. The system is both wide-spread and ancient. With regard to its antiquity Buchanan Hamilton classes "share-cultivators" with common labourers, and "low artificers" such as basket-makers and washermen among the poorest class of the society. The *adhiars* are, however, rather better off than labourers. Their number is stated to be "very considerable." They were men who had one or two ploughs which they worked themselves. If they could work more land they took more in *adhi*, and for six months in the year they, together with the small *rai*yats were financed by the big cultivators of the over-thirty-acres class by advances in cash and grain. In 1938 the net sown area shown as cultivated by *adhiars* varied from over 24 per cent. in Bansuhari to 13 per cent. in Kaliaganj and Kushmandi. There is general agreement that these figures are on the side of under-statement. The variations between different thanas probably represent a real difference and not just slack work.

The system is ideal for paddy. All crop which requires little capital and no expensive operations like weeding, watering, or ditching, such as are necessary for

growing jute, onions, sugarcane or chillies. One paddy can be grown very successfully by a man who has no capital except his own strength and ploughs and cattle.

Out of 1,524 *adhiars* 692 held less than one acre in tenancy right and a further 518 between one and five acres. That is, four-fifths of the *adhiars* held less land than is necessary to maintain a family and have to take *adhi* land in addition. As many as 103 were shown as having over ten acres. Perhaps co-sharers' lands were included, but it was agreed that a number of substantial cultivators take settlement of *adhi* lands to get extra profits and to secure maximum employment of their stock. It is not usually for the same *adhiar* to remain long on the same piece of ground. Indeed the attraction of the system is that men can be changed, or could try their fortunes elsewhere every fresh season.

The following shows in percentage the duration of *adhi* land held by present *adhiar*:

Up to 3 years	56
3 to 6 years	23
6 to 12 years	11
Over 12 years	10

Such a statement must be accepted with caution and many among the Settlement staff thought that through fear that long possession would create a right, the land-holders understated the length of time the *adhiar* had been in possession, and frightened the *adhiar* into consent. Nevertheless as returns are more or less uniform there is truth in these figures.

A certain number of people give land in *adhi* because they are incapable through widowhood, minority, or old age and from sickness from cultivating themselves and supervising work of labourers. But the enquiries made by the kanungos working for the Land Revenue Commission clearly proved that most land is given to *adhiars* because the *rai*yat or jotedar has got more land than he can cultivate himself, even if he and his family worked full time on the land.

Although the extent of the system is some indication of its popularity, there is evidence that most jotedars of cultivating stock prefer to cultivate by their own ploughs, or by hired labourers, and give land in *adhi* because they have not time to superintend the work on all their lands. Big Muslim or Rajbangshi jotedars may cultivate as many as 100 bighas by their own ploughs and labourers, and one Mahiyya jotedar was reported to keep as many as 138 ploughs. Such people say that "nij hal" is more profitable than cultivation through *adhiars*. But poor soil may be better cultivated through *adhiars*, because it is better to get half of anything than to lose money on paying for labourers. The unfortunate *adhiar*, being anxious to make any sort of income, has to take any land offered.

On the other hand, the non-resident, or non-agricultural man who has land, prefers to cultivate through *adhiars*. It is said "Adhi is more suited for gentlemen."

Any proposal to give tenant rights to *adhiars* must be considered in the light of local ideas as to customary rights. The argument for making *adhiars* into tenants is that the *adhiar* is essentially a peasant; a man who cultivates the land for his family subsistence, using his own plough and cattle; that his present position is precarious, and it is not in the public interest to have a large mass of people in the countryside with no permanent interest in the soil. It is true that the *adhiar* holds a precarious position and instances have been found by the threat of withholding *adhi* settlement has been used to force surrender in social quarrels, and civil and communal litigation.

APPENDIX II—contd.

The argument for refusing to extend rights to *adhiars*, is that the *adhiars* do not regard themselves as having any rights; that they change their land and their "giri" (the jotedars) very frequently; and generally, by the custom of the country are regarded more as a servant of the jotedar or landlord than as independent landholders. They are mostly the poorer villagers and the jotedars finance them through the difficult months. The jotedar also decides what crop is grown, and it is frequently divided at the *khamar*, or other place appointed by the jotedar, a sign of the master and servant relationship.

It is likely that the *barga* or *adhi* system requires different treatment in different parts of the province; but the balance of advantage in dealing with the *adhiar* of Dinajpur would seem to be on the side of inaction, and of non-intervention, until it is more evident than it is now, that the *adhiars* themselves really want more permanent rights.

Yield per acre and fertility of the soil—The district average may be put at about 17 maunds an acre for *aman* paddy. Experiments were carefully undertaken and individual experiments range from 6 maunds per acre to 30 maunds per acre. But the fact that the general trend of so many experiments over five seasons is so similar, is some guarantee of the general accuracy of the results which are 1.7 maunds of unhusked paddy on one-tenth of an acre of land. It does not, however, follow that a cultivator will get 17 maunds an acre from a holding of several acres of rice land, particularly after allowing for deterioration and waste in golas.

Aus paddy—The estimate of the staff based on their own local knowledge and local information is that the yield averages about 12 maunds an acre.

Boro paddy—A very few crop-cutting experiments were done on *boro*, which show 23 maunds to the acre, almost the same as the 24 maunds given by the Settlement Officer of Malda.

If the cultivators themselves are to be believed, the fertility of the soil is decreasing, for on all sides one hears the complaint that the soil does not give as much as it did. It is difficult to examine this complaint objectively, for there is so little evidence as to what crop yields are now, or were at different times in the past. The average yield of winter rice, as shown by 280 experiments of one-tenth of acres appears to be 17 maunds to the acre. The Director of Agriculture's figure is 21 maunds, though I believe this to be somewhat too high. If cultivators' own statements were to be believed, the yield would have to be put at about 6 maunds an acre. One must refer to Buchanan Hamilton for any serious estimates of yields in the past. He quotes some farm accounts given him by actual cultivators, and these place the actual yield of *aman* paddy grown as a single crop at 30 maunds an acre and from 18 to 36, with an average of 28. These were the cultivators' own statements and cultivators are no more likely to have overstated their crops than now. This, for what it is worth, is some indication that the outturn of paddy is rather less. Sherwill's Revenue Survey Report did not venture to give any estimate of yields, but in 1870 the Collector reported to Hunter for his Statistical Account that a good average yield from land paying a rent of Rs. 1/8/- per bigha is from 8 to 10 maunds of paddy a bigha, i.e., 24 to 30 maunds an acre. This is a much higher figure than any one would assert today to be a normal outturn of paddy, but the Collector's justification for his estimate is unknown, and suspicion is thrown upon his statement by the reference to Rs. 1/8/- a bigha or Rs. 4/8/- an acre. Such a rent is most unusual today, being more than twice the district average for *raiya* rent, and is altogether incredible for any but a freak rent in 1870. Also a few pages earlier there appears a

statement "The soil appears to have decreased in productive power by over-cropping; and it is said that the land now produces less by one-fifth than what it did 25 years ago." Things never are what they were. At the same time a Deputy Collector reporting to Hunter from Rangpur put the yield of *aman* rice from one-crop land at 21 maunds an acre, and from two-crop land at 15 maunds an acre, figures which do not vary greatly from present estimates, and it is not obvious why yield in Dinajpur should have been so much more than in Rangpur. One must conclude, therefore, that what the Collector wrote in 1870, is poor evidence that the yields are less, though as regards rice, the opinion must be recorded that there is some reason to believe that outturns are less, but that the matter is very open. For other crops there is no evidence that yields have in any way diminished, but rather the contrary. Buchanan Hamilton puts the yield of mustard seed at 5½ maunds an acre—not very different from Settlement figures—and of jute, at 9 maunds an acre, as against the 6 of cultivators' own statements, but even his estimate is much lower than any figure which is accepted today.

The opinion of those who have worked long in the district is that cultivation here compares unfavourably with what is seen elsewhere, in Rangpur for instance. Attention has been drawn to the low proportion of two-crop land in the district. One cannot afford to ignore the possibility that under Bengal conditions and with the Dinajpur cultivators' limited desires, a population of under 600 to the square mile is not enough to grow two crops an year, or to get much more out of the soil than is obtained now. As it is, great number of Bihari and Santhal labourers comes into the district every winter to help with the harvesting. Moreover, it appears that ploughing, harrowing, and weeding are all done less thoroughly than in Rangpur. The soil is worked to less fineness than what is seen elsewhere. Large clods are left about and the "mugur" or clod-breaking mallet is comparatively little used. Again weeding of jute and aus paddy is haphazard. Many people have commented upon the casual or half-hearted way in which the summer crops are weeded in the north of the district.

Average land per agricultural family—The same figures have been tabulated from the Economic Enquiries made by Assistant Settlement Officers. It was noted that though a few 100-acre land were available, there were no giants who held thousands. The results may be compared with those obtained from the Land Revenue Commission. The enquiries of the Land Revenue Officer show that about five-eighths of the persons in 3/4th of the families held less than five acres of *raiya* land, and hence must, in all probability, have some source of income other than those lands. The enquiries of Assistant Settlement Officers over four years show that families which include between a third and a quarter of the total population are in possession of rather less than two-thirds of the land.

The following is a statement of land employment in the district as at present constituted—

Description	Area
Area sown—	•
(a) Bhadoi ..	76,123 acres
(b) Aghani ..	552,895 "
(c) Rabi ..	90,687 "
(d) Others, e.g., mango, til, pan, plantain, guavas, etc. ..	7,487 "
Total ..	727,192 "
Dofasli ..	53,700 acres
Net area sown ..	673,492 "
Current fallows ..	33,708 "
Culturable area other than current fallows ..	88,544 "
Area not available for cultivation ..	91,422 "

APPENDIX II—concl'd.

Description	Area
Total uncultivated area (current fallow, culturable area other than current fallows and area not available for cultivation) ..	213,734 acres

Area of the district ..	890,904 ..
Irrigated area

The following is a statement of crops in the district:—

Description	Area
Rice—	
(a) Aus	51,895 acres
(b) Aman	534,656 ..
(c) Boro	1,008 ..
Wheat	3,195 ..
Barley	4,037 ..
Gram (pulse)	3,426 ..
Other foodgrains including pulses	10,662 ..
Oilseeds—	
(a) Linseed	1,138 ..
(b) Til	308 ..
(c) Rape and mustard ..	52,671 ..
Sugarcane	1,757 ..
Jute	20,570 ..
Tobacco	1,459 ..
Fodder crops, including Joar and Kalai	555 ..
Fruits	4,365 ..
Potato	4,229 ..
Total area sown	727,192 ..
Area sown more than once ..	53,700 ..
Net area sown	673,493 ..

A very high proportion of land in this district is cultivated by *bargadars*, the ownership being concentrated in the hands of more intelligent jotedars known as the *deonams*.

The following agricultural statistics are given for a little less than the district area:—

	Cultivated area and its percentage to the total area	Cultivated waste and its percentage to the total area	Unculturable and its percentage to the total area
Ishaque Survey ..	599,577 80	57,055 7	95,191 13
Settlement (1934-40)	583,035 77	94,012 12	85,369 11

Under this survey there were 6,249 acres of forests and jungles and 20,057 acres under various descriptions of water.

The portion under sal forests is productive addition to the economic resources of the district. But that under other forests, beels and marshy lands, is waste. If reclaimed, this would not only add to the acreage under cultivation of crops, but it would also go in improving the health of the district. The acreage under culturable waste has decreased and that under unculturable waste almost constant. The decrease in the acreage under culturable waste may be attributed to the higher prices in the agricultural commodities in recent years.

The general tendency of the agriculturist is to grow as much *aman* as they can. The other crops grown include jute, *rabi* and tobacco. The general productivity has been deteriorating slightly. Proper manuring is rare, nor any rest given to the lands. Fresh silt deposits do not play any conspicuous part. The acreages under *aman*, *rabi* and *bhadoi* are given below:—

Crop	Ishaque Survey	Settlement
Aman ..	512,916	504,606
Rabi ..	46,642	60,566
Bhadoi ..	56,526	48,329

It will appear from the above that acreage under *rabi* has decreased and that under *aman* and *bhadoi* has increased. The increase in the acreage under *aman* paddy may be attributed to favourable weather conditions.

The following is a statement of crops in the district:—

Paddy—			
(a) Aman	538,942
(b) Aus	73,907
(c) Boro	212
Total	613,061
Wheat	3,102
Barley	5,694
Gram (pulse)	5,173
Total area under cereals and pulses (other than rice)	26,734
Sugarcane	1,647
Oilseeds —			
(a) Til	195
(b) Rape and mustard	34,040
Potato	2,939
Jute	16,254
Mango	4,036
Tobacco	1,559
Area not available for cultivation including water	101,745
Culturable area but not yet cultivated:—			
(a) Culturable waste	45,613
(b) Jungles	8,813
Total	66,730

Total area of the district 885,426

The following is a comparative statement of Ishaque Survey and District Settlements figures:—

Description	Ishaque Survey	Settlement	Difference
Unculturable waste including water	101,743	91,422	+ 10,321
Culturable waste	66,729	88,544	— 21,815
Cultivated:—			
Aman paddy	538,942	534,656	+ 4,286
Total area of the district	885,426	890,904	— 5,478

The following is a statement of density of population, per capita crop and paddy areas in the district:—

Total population ..	583,484	
Total area of the district ..	890,904	acres
Density of population per sq. mile	421	
Total cropped area (net cropped and dofasli) ..	727,192	"
Per capita cropped area ..	1.25	"
Total paddy area ..	613,062	"
Per capita paddy area ..	1.05	"

APPENDIX III

Extracts From

An Account of the District of Dinajpur in 1808-9 by Dr. François Buchanan Hamilton

(Drawings referred to in this account have not been reported)

I SOIL

The soil, when dry, is in general of a very light ash-colour, often almost white, but becomes dark when moist. In a few places, however, chiefly near the Koro-toya, the soil is a very red and stiff clay. Such soil, wherever found, seems to be called *Ranggamati*, and many places derive their name from this circumstance; for in Bengal this kind of soil is rather unusual. The common ash-coloured soil, which occupies more than 99 per cent. of the whole district, is of two kinds.

The one, in dry weather, becomes exceedingly hard and impenetrable, and retains very little moisture, so that in the heats of spring it is entirely destitute of vegetation. In wet weather again, it changes into a soft sticky mud. This is called *Khyar* and *Matiyal*. The first expresses its parched state during the dry season. The latter is said to be a provincial corruption for *Athia*, which implies its sticky quality during the rainy season. Another derivation is given of the first appellation; it is said to signify saline or alkaline, and much land in Bengal is, no doubt, of that nature; but this is by no means the case in Dinajpur.

The other ash-coloured soil contains a much larger proportion of sand, on which account, it is said to be mixed (*Doangsh*). This is much more retentive of moisture than the purer clay, and in the dry season produces more vegetation. Its tenacity also being diminished by the mixture of sand; even the wretched implements and cattle of the native are able to penetrate it in the dry season, so that it produces a crop with the early rains of spring, while the hard clay is still impenetrable to the plough.

The greater part of the stiff land produces, therefore, only one crop of rice, which is sown in the middle of the rainy season; but with the occasional rains, that happen in winter and the early part of spring, some portion, often a considerable one, is ploughed, and then produces two crops of rice.

A great proportion of the mixed land produces either two crops of that grain, or a great variety of valuable articles, that grow in the dry season. On this account it is frequently called *Poli* or the nourishing soil.

Much confusion, however, prevails in the application of the terms *Khyar* and *Poli*. Mr. Hatch, when he made the settlement of the estate of the Dinajpur family, assumed this distinction, as the foundation of his estimate. He considered as *Khyar* all such land as produced only one crop, and as *Poli* all such as was capable of producing two crops in the year. As, however, some of the former is really more valuable than much of the latter, many exceptions were made, and much land really of a stiff soil is reckoned *Poli*, while much of a mixed soil is only considered as *Khyar*. Among this last may especially be mentioned, the sandy banks of many rivers, which do not contain clay enough to enable them to produce many rich crops, but which are very capable of producing certain articles with the early rains of spring. The soil is usually called *Chora* by the natives, as being situated on the bank of a river, or *Bahiya* as consisting mostly of sand. The extent of this cannot exceed 2/3 per cent. of the land in this district, while the red earth may occupy 1 per cent. the real *Doangsh* 46, and the *Khyar* 53.

MINERALS—It is impossible to find a district less interesting to a mineralogist than Dinajpur, as it consists entirely of soil, sand, and clay, and these in no

great variety. The soil is seldom very deep. Under it is often a bed of clay; but sometimes even this is wanting, and the soil rests on sand.

The clay is of three kinds: first, a black moist smooth clay; second, a red hard clay, which contains black angular concretions that are sometimes indurated. This resembles entirely a porphyry in a state of decomposition. Third, a yellow hard clay, which contains much ochre, sometimes in a sort of veins. It also frequently contains small rounded pebbles, and seems to be a rock in a state of decay. All these are fit for the potter, and all of them become red in the kiln.

The sands are of two kinds: first, large-grained dark-coloured sand, mixed with black mud; when water is found in this, it is always bad; second, a fine light-coloured sand of quartz and mica. In digging wells, the water is usually found in this, and is generally very good.

The wells in the stiff-clay land are in general best, as that soil prevents the surface-water from penetrating. In some places, such as between the Tanggon and Puna-bhobu, water has seldom been procured by digging; and when it has been found, the wells have been at least 60 feet deep. In other parts, such as Bongsihari, it is usually found at a depth of from 20 to 30 cubits; but in most places it is found at a still less depth.

It is said, that formerly, where Rajgunj now stands, the people used to dig out a clay called *Khorimati*, with which they white-washed their houses. Such earths are common in many parts of India, and are shistose mica or granite in a state of decay; the mica being the predominant and colouring matter. It is said, that Mr. Hatch, formerly magistrate ordered the pit to be shut, which is not at all probable.

In some parts of the district, nitre was formerly made; but there seems to have been nothing peculiar in the soil, and it might be made equally well any where with the earth taken from the floor of cow-houses, as was practised here. The Company has of late withdrawn the manufacture to more favourable situations.

II DIVISIONS

Division of Hemtabad

By far the most celebrated Muhammedan place of worship, either here or in the vicinity, is near Hemtabad, and is a (*Durgha*) monument, dedicated to Mukhdum Dokorposh, where the saint's tomb is shown, and where there is a small rude mosque of stone, adorned with pillars and carvings, which, it is evident from their containing human figures, have been taken from Hindu buildings. In the market-place at Hemtabad, the same saint has a monument, which is much frequented on the day appropriated for the commemoration of his name; and near his own mosque, which was adjacent to his house, he seems to have erected another in memory of Kotub Shah, who was the most holy personage in the reign of Ghyas-uddin, as Dokorposh seems to have been in the reign of Sultan Hoseyn. The mosque of Kotub Shah has also been ornamented with stone pillars, the spoil of infidels. Four *fakirs* attend the mosque of Dokorposh, which is in tolerable repair, as well as the tomb, but the other buildings are quite ruinous. They have 500 bighas of land, free of rent, but it is of a wretched soil. This mosque, from an inscription over the gate, would appear to have been built in the year of the Hegira 996, by Sultan Hoseyn.

APPENDIX III—contd.

At Baliyadighi is a mosque near a tank, which has an endowment of 1000 bighas of land; and the fakir, who has the hereditary charge, lives in a brick house, and in a decent manner. There is no Hindu place of worship of any note.

The antiquities of this district are rather interesting, and are situated immediately west from Hemtabad. It is said that formerly there governed at this place, a Hindu raja, named Mohes, to whom much of the neighbouring country was subject. During his government, a certain Muhammedan saint (*Pir*), named Buzerudin, came and sat down at his gate, where he seems to have been but coldly received. Soon after, came a still more celebrated person, Mukhdum Ghuribal Hoseyn Dokorposh, and the raja immediately fled to Dhaka, which he is said to have founded. The *Pir*, I should suppose, was accompanied by an army, but tradition by no means supports this conjecture. On the contrary, it is said, that the raja fled merely because he was shocked at the destruction which the two barbarian saints and their attendants, committed on innocent cattle and poultry; Mohes, therefore, was probably very different from the Hindu rajas of the present day, as indeed all rajas of former times are said to have been. A Muhammedan saint, in these days, who attempted to kill a cow in a Hindu country, would run great risk, unless he was protected by an army. In support of my opinion, I must mention, that soon after Mohes had been expelled by the saints, Sultan Hoseyn appears to have been at the place, and gave his daughter in marriage to Mukhdum-uzi-udin, brother to Dokorposh. The son by this marriage, Mukhdum Shah Bazil, is said to have retired to Sondwip, and took up his abode there; but his son Jamaludin returned here, and was buried near his grand uncle. In the inscription on his tomb, it must be observed, that he is called Jamaludin, son of Shevkh Yahia. On the whole I am inclined to believe, that Mohes raja was sovereign of this part of the country, which, not being included in the provinces of Barondro or Maitthila, did not probably belong to the kingdom of Gaur, until the time of Hoseyn the conqueror; and this territory may have been the country called Kamacah, which he added to his dominions. Having premised so much on the history of the place, I shall now describe its present appearance.

Near a tank, a little way west from Hemtabad, there is a space of ground about half a mile in diameter, over every part of which bricks are thickly scattered, and in some places the foundations of walls may be traced. In some places, this is thickly covered with trees and bushes, and in others, it is clear: at the northern end is a small hill, formed of bricks, and said to have been the public office (*Kuchery*) of Mohes raja. On the surface are a good many large squared stones, of which material, probably, a considerable part of the building consisted. South from that, about 100 yards, is a still larger heap of ruins, and here also are several stones, one of which, apparently the lintel of a door, is a good deal ornamented. This ruin is said to have been the raja's house. Immediately south from this heap are shown the foundations of a small square apartment, made of bricks in the centre of which is a tomb, said to be that of *Pir Buzerudin*. The door of stone is still erect, and as will appear from the drawing, (No. 2) has been handsome. From the figures on it, the workmanship is, no doubt, Hindu, and in all probability, it has been a door in the raja's house; at the south end of the ruins are the mosques and adjacent buildings, which I have no doubt, have also been built from the materials of the raja's abode. A door in the outer wall has still more perfect figures, than that which has been drawn; and the figure on the lintel strongly resembles the image of Gautama and his two favourite disciples, as usually represented in the temples of Ava. The pillars are remarkably clumsy, quite in the Hindu style; and

being all of different forms and lengths, could not have been originally intended for the places which they now occupy. Besides, on a stone lying near the mosque is carved a human figure, quite entire. I have given a drawing of this building, (No. 3) as being one of the most entire in the district.

About a mile and a half beyond this ruin is another, which has been surrounded by a brick wall, and is usually called the *Tukht* or throne of Hoseyn (*Padshah*) the king. The *tukht* consists of a quadrangular truncated pyramid, of about 20 feet in perpendicular height, and is composed of bricks heaped confusedly together, intermixed with these are some large carved stones, evidently of the same style as those of Mohes raja's house; but whether they have been brought from thence, or whether they are the ruins of a temple, that formerly may have been on the spot, I cannot say. On the summit of this pyramid is a considerable square area, in the centre of which a terrace has been raised about three feet high; and this has been regularly built with cement, and its sides have been ornamented with mouldings covered with plaster. It was here, it is said, that Hoseyn Shah sat, and beheld sports which were exhibited at the nuptials of his daughter. South from the pyramid are the ruins of a brick building, the roof of which has fallen in, but the walls are standing, and have been encrusted with carved bricks. The building is nearly square, with arched doors and windows, and is elevated on a brick terrace about five feet high. This is said to have been the house that was erected for the accommodation of the princes during the ceremony, after which the whole seems to have been given to religious men. The tombs of two saints (Welent and Bahador Shals) now occupy the throne of the king, and many tombs of saints and *fakirs* surround the pyramid. There is a small endowment of land for supporting the *fakir* who supplies the lamps burned at the tombs of the most distinguished of these personages.

Between the two ruins many bricks are scattered on the fields, and a very wide road, with a ditch on each side, may be traced most part of the way.

Division of Kallyagunj

The only remains of antiquity that I saw or heard of is at Borogang, in the southern part of the division. These are several mounds, consisting of bricks, covered in a measure with soil, and extending about 30 yards in diameter. Near them are many small tanks, like those of a Bengal town. On one of the mounds is situated the tomb of a Muhammedan saint, surrounded by a brick wall. The *fakir* says, that it was built by one of the Bengal kings, which is very probable; but his authority is as nothing, for he was a poor illiterate creature, with a silly show of devotion. Even while I was speaking to him he continued to mutter prayers and to sob forth pious ejaculations. Around the monument (*Durgah*) are a good many stones, like those at Hemtabad, but less ornamented. There is no tradition concerning the founder of the ruin. I have no doubt of its having been a Hindu edifice, and that the monument has been built from its materials.

Division of Bangalhari

In this division there is no place of worship of any note, but there are several antiquities near the thana; at about half a mile south from this place is a small Hindu temple, called a Mondir, a work apparently of considerable antiquity. Its base is a quadrangular prism, about 20 feet high, and 12 wide. Its summit is a pyramid of about the same height. This part of the building has been much ornamented with carved

APPENDIX III—contd.

bricks, especially a kind of escutcheon on each face, that possesses some degree of good taste. The artists have been ignorant of the method of constructing an arch; for the door is contracted above, to a point, by the horizontal rows of bricks gradually encroaching on its width; not the smallest tradition remains concerning its founder, and the image has been removed.

At a little distance west from this *mondir* begins a narrow elevated ridge of land, perhaps half a mile wide, which extends west to the Beliva about two miles, and seems to me entirely artificial. It is every where full of small tanks, inequalities, and heaps, many of which consist almost entirely of bricks. The largest of these has been lately opened, probably in part to look for hidden treasure, and in part to procure bricks for building an office (*Kuchery*), for collecting the rents, and this latter view has not been in vain. The building has probably been a temple, in form of a polygon. The outer wall is about four feet thick. At the western end of this elevated space are two tanks of considerable dimensions, which are almost filled up, and entirely choked with weeds. The place is called Brojibollo-bhopur, and I have no doubt has been a considerable town; but no tradition remains.

About 1½ mile west from the Beliva, is a very large tank, called Melandighi, which is nearly choked with weeds. The only tradition concerning it is, that it was dug by a prince (*Rani*), and that a miracle was necessary to procure water. About 1½ mile further west is Gordighi, a tank, the water of which has extended about 600 yards N. and S. and 400 yards E. and W., and which of course is a Hindu work. A considerable portion of it has now so far filled up, that it is cultivated for rice. About 1,200 yards west from this tank is another, called Altadighi, which extends nearly to the same dimensions, but is placed with its greatest length from east to west, and therefore is a Muhammedan work. Between these two tanks are the ruins of Borohata, which are very large heaps or mounds, that consist in a great measure of bricks. In many places the foundations of walls may be traced, and even the dimensions of the chambers. All these chambers are of a small size, owing to which they may have resisted the attacks of time better than more spacious apartments. They are chiefly situated in the southern division of the town called Kutwari. In this part are some small tanks that have evidently been entirely lined with brick. In the centre of the ruins are indubitable traces of a small square fort, which has been surrounded by a double wall of brick, and an intermediate ditch. The ruin to the north of this fort is almost entirely without the trace of regular form, but the quantity of bricks which it contains is great. At its northern extremity is the monument of a Muhammedan *Pir*, Badul Dewan, which is built of bricks; in its gate are two stones, but there is nothing about them to determine, whether they have been brought by the founders, or taken from the ruins. There is no sort of tradition concerning the persons who either founded or destroyed these works.

I observed also in this division, on the road towards the S.E., two places where there small tanks, and heaps of earth and bricks, which may have been towns; but there was nothing about them which indicated their ever having been places of considerable importance.

In the N. E. part of this division is a very large tank, supposed to have been dug by Mohipal raja, and called after his name (Moybuldighi R.). The sheet of water extends 3800 feet from N. to S., and 1100 from E. to W. Its depth must be very considerable, as the banks are very large. On the bank are several small places of worship, both Hindu and Moslem, but none of any consequence; nothing remains to shew that Mohipal ever resided either at the tank, or at Mohipur, near it; but there is a vast number of bricks, and some

stones, that probably belonged to religious buildings, that have been erected by the persons who constructed the tank. One of the stones is evidently the lintel of a door, and of the same style with those at Bannagor, and may have been brought from the ruins of that city. The people in the neighbourhood have an idea, that there has been a building in the centre of the tank; but this is probably devoid of truth, as there is no end to the idle stories which they relate concerning the tank and Mohipal. Both are considered as venerable, or rather awful, and the raja is frequently invoked in times of danger. A canal and road, formed from the earth, thrown out, leads south from the tank, about four miles, where they join others leading east and west, but to what distance I did not ascertain.

Division of Gongarampur

The antiquities of this district are very numerous; and in giving an account of them, I shall have occasion to mention most of the places of worship, and most of the public works of any note. I shall proceed in the order in which I saw them.

First, about seven miles southerly from Dumdum-mah, is a very fine tank, named Topon (Tubbone R.), and the largest in the district; for the water seems to have extended 1100 feet from N. to S. and 1150 from E. to W. and the space occupied by the bank is about 300 feet wide, making the total dimensions 4700 feet by 1750. On the east and west sides have been three entrances through the bank, each had a descent to the water (*Ghat*) lead with brick. On the south side have been two entrances, and on the N. side, one; opposite to this is a small heap, probably the ruin of a temple, and beyond this an avenue between two small tanks, which, together with the avenue, occupy the width of the great one. To the north of these is a space of about half a mile in extent, broken with small tanks, like the situation of a town; and near the northern extremity of this is a large heap of bricks, covered with soil, once probably a temple of considerable size. These tanks are said to have been made by Ban raja and to have been the place where he performed his religious ceremonies (*Toposya*), and where he swung before Shiva for 1000 years, suspended by hooks passed through the skin of his back. It is from this that the name of the place is derived.

East from Topon, on the banks of the Punabhoba, is Kordaho, now a place of some trade, but celebrated as having been the place where Krishna burned the 998 arms of Ban raja, which he had cut off in battle.

The proper name of Dumdum-mah is Devi Kot. It received its present appellation (which signifies the place of war) from its having been a military station during the early Muhammedan government, as it probably was then on the frontier; for I have already mentioned that the province called Barendo extended no farther north than this place. While the troops were stationed at Dumdum-mah, the chief officer, under the title of Wazir, seems to have resided on the banks of a very noble tank, which is named Dahal Dighi, and has evidently been formed by Muhammedans; its water being about 4000 feet from E. to W. and 1000 from N. to S. It is probably exceedingly deep, as the banks thrown out are very large. They have been a good deal spread, and form many irregular rising grounds, finely planted; and surpass in beauty anything of the kind that I have ever seen. On many different parts, especially towards the N. E. corner are heaps of bricks, probably the ruins of the houses that were occupied by the Moslem officers. On the centre of the north side is the monument (*Durgah*) of a saint (*Pir*) named Mullah Ata-ud-din, contiguous to which is a small mosque. Both are very ruinous, but a canopy is still

APPENDIX III—contd.

suspended over the tomb, which is much frequented as a place of worship and the *fakir* has an endowment of 200 biggahs (about 100 acres) of land. The present occupant is a remarkably handsome man, and has a perfect formed Arabian countenance, although his ancestors have held the appointment for several generations. A descent, paved with stone, leads down from these buildings to the tank, and the materials have been evidently taken from a ruin, as broken columns, parts of doors, windows, and stone variously carved, are intermixed with such as are quite plain. Traces of the human form on the pedestal of a column shew that the ruins from whence they were taken have been those of a Hindu building, and confirm the tradition of the supply having come from Bannogor. The Wazir, who is reported to have founded the mosque and to have dug the tank, is said to be buried between them, and a large cavity covered by long stones is shown as his grave. From an inscription over the gate of the mosque, it appears, that it was built before the time of Ala-ud-din, and of Sheikh Mukbu (another saint), by Wazir Shair Musaur of Mozofurabad, commander of the troops of Piruzabad, in the reign of Hoseyn Shah, Sultan of Hostina, son of Mosofur Shah, A.H. 718. From an inscription under the former, it would appear, that a place for prayer (*Gombuz*), which has been erected behind the tomb, was built by the order of Sekandar Shah, son of Majahud Shah, son of Avaz Shah, A.H. 765. Also from an inscription in a wing of the mosque, it would appear, that this was erected as a place of prayer of Ala-ud-din by Futeh Shah, son of Mahmud Shah, A.H. 854. A part of the mosque, called Hamada, from an inscription in it, was built in the reign of Kykaos Shah, by the order of Sakandar Sani or the 2nd, A.H. 872. Finally from an inscription over the door of an apartment to the right of the mosque, and which was a kitchen for the use of *fakirs*, it would appear, that it was built in the time of Mukhdum Mullah, when Mozofur Shah was king. The date is no longer legible.

At a little distance east from Dahal Dighi is another tank of very large dimensions, called Kala Dighi and supposed to have been dug by Kala rani, the spouse of Ban raja, exclusive of the banks it is about 4000 feet long from N. to S. by 800 feet wide.

North from the tanks called Dahal and Kala are many small ones, which formerly in all probability were in the suburbs of Bannogor, the residence of Ban raja, of whom I have already given an account.

The ruins of Bannogor occupy the east bank of the Punabhoba, which here runs from N. E. to S. W. for about two miles, beginning a little about Dumdummah. I first examined the citadel, which is a quadrangle of about 1800 by 1500 feet, surrounded by a high rampart of bricks, and on the south and east by a ditch: the remainder of the ditch has been obliterated or destroyed by the Punabhoba, which in the time of Ban raja is said to have passed to the north of the present course of the Brohmani; and many large water-courses, which are to be seen in that direction, render the tradition probable. On the west face of the citadel is a large projecting part, probably the outworks before the gate. In the centre is a large heap of bricks said to have been the raja's house; and on the east face is a gate and a causeway, about 200 feet long, leading across the ditch into the city, which has been a square of above a mile in diameter, and has been also surrounded by a rampart of brick, and by a ditch. Towards its S. E. corner is the monument of Sultan Shah, which is ruinous; but a *fakir* has a small endowment, and burns a lamp before the tomb. The monument is much frequented by the faithful, and contains many stones, which from their position have evidently been taken from ruins, and pillars are of the same order with those

at the mosque of Dahal Dighi. They are somewhat more elegant than those at Adinah, and I have procured a drawing of one (No. 9), and of a door (No. 10), which I have no doubt belonged to Bannogor.

Near the monument of the Muhammedan saint are the two celebrated pools Omrito and Jivot, which I mentioned in my account of Ban raja. In their present state they are very different from the pools of life and immortality, which their names imply, as they are filled with abominably dirty water. They have never been large but the size of the heaps of bricks round them shewn, that they have been surrounded by large buildings; and probably they have been sacred ponds (*Pushkorinis*), which occupied the areas of two temples. The women of the vicinity who have been unfortunate in their children, and have lost many by death, frequent these pools, and carrying with them two living fish of the kind called *Kamach Snugg*, bathe in each pond, and make an offering of a dish.

In Omrito a projecting stone was pointed out as the dead cow that had been thrown into the water by the infidel Yovons, in order to deprive it of its virtues. I proposed to take it out, which excited a smile of contempt in my guides, who assured me, that one of the Dinajpur rajas had tied ropes to it, and with three elephants had attempted in vain to procure this monument of antiquity. The pandit attached to the survey, who is perhaps somewhat of a philosopher, went next day with a dozen men and some ropes, and pulled it out with some degree of exultation. He found it to be an image of the bull Vrisho, which is usually worshipped by the sect of Shiva, and which the infidels very probably threw into the pond. This and the image of Gones now at Dinajpur, which I have already mentioned, together with the custom of swinging attributed to Ban raja, pretty clearly show the religion of that tyrant (*Osar*) who opposed Krishna, as the temples of Shiva constructed by Raveon, which I have seen in the south of India, point out the worship of the opponent of Ram.

At the N. W. corner of the ruins of the town, near the Punabhoba, are the remains of the monument of another Muhammedan saint, *Pir Huvakhari*, which also have some columns, and other stones; and the same *fakir* who lights the lamp at the tomb of Sultan Shah attends on this, which is also much frequented by the devout.

Near this the river has undermined part of the ruins, and is encroaching on a thick bed of bricks, in which stands a column of granite of the same order with those in the monuments of the Muhammedan saints.

At a very little distance from the N. E. corner of the city is a large heap of bricks, said to be the ruins of a temple dedicated to Virupakhiyo (*Shiva*) by Ban raja. In the time of Raja Ramnath of Dinajpur, two religious men were informed in a dream where the image was concealed, and hastened to inform the raja of their discovery. He accordingly sent people with the two good men, who pointed out the place in the ruins, and on digging there was found a Linga, for which the raja built a small temple, and settled 360 biggahs (about 180 acres) of land, with a monthly pension of 30 rupees on the two brahmuns, whose children now enjoy the fruits of their ancestors' virtue. It is said and believed in the neighbourhood, that this image, when discovered, was a cubit high. It has since gradually diminished, and is now reduced to a span. The new temple is very ruinous, and the brahmuns who have the endowment will probably wait for a repair, until another dreamer can procure another raja, who will perform that work of piety. It is now, however, the chief place of Hindu worship in the division.

APPENDIX III—*contd.*

About half a mile west from the north end of the city, on the opposite side of the Punabhoba, is a considerable heap of bricks, overgrown with bushes, and placed on the side of a small tank. For any thing that appears to the contrary, this, as is related, may have been the house of the princess Usha, whose fondness for Oniruddho brought about the destruction of her father and native city.

About three-fourths of a mile beyond this heap, and on the other side of the Brohmani, is a place called Narayonpur, where there are many small tanks and heap of bricks like an old town. This is said to have been the field where the great battle took place between Krishna and Ban raja. Near one of the tanks, evidently of Hindu construction, is the monument of a Muhammedan saint, *Per Baha-ud-din*, from whence to the tank is a large pavement and stair, constructed of stones, that have evidently been taken from ruins. Near it is a small building of brick, much ornamented with carving, and which from its resemblance to the mausoleum of Ghyas-ud-din, at Pernya, probably contains the tomb of some person of rank.

The great number of stones in these ruins, and a vast many that have been removed by the Dinajpur rajas, to construct their works, show that Bannogor has been a place much ornamented and its walls show that it was of considerable size and strength. The people here allege, that all the stones which are to be found in the buildings of this district have been carried from it, and that Gaur owed its most valuable materials to the ruins of Ban raja's edifices.

III

ON THE POPULATION OF THE DISTRICT, AND THE CAUSES WHICH OPERATE ON ITS INCREASE OR DIMINUTION

On the important subject of the number of inhabitants, I have little or nothing to offer that is satisfactory, for no enumeration has been made by the officers of police or revenue.

A list, called *Khaneh Shumari*, containing a statement of the number of houses, families, tradesmen, castes, ploughs, looms, tanks, and other public works, religious and civil, that are under the care of the magistrate, is very commonly kept in native governments, and seems to be useful, where attention is paid to have it tolerably exact, which may in general be easily accomplished, and I have never heard that the people were alarmed by the execution. I cannot however take upon myself to assert, that such a measure would not occasion alarm in Bengal, because the people, for some time at least, have not been accustomed to it; but I was told that several of the proprietors of land had made such lists for their own estates, without which indeed I cannot imagine how they should be decently regulated, neither did I hear that this had given any alarm or disgust to their tenantry. I was promised a sight of one of these documents; but the promise, as usual in such cases, was not performed.

The only manner that I have of calculating the population is from the extent of cultivation, which is of course liable to great error. Two calculations may be founded on this basis.

First. It will appear in my account of the agriculture of this district, that about 4,80,000 ploughs are required, and one man is the usual allowance for each plough. The men employed in actual agriculture cannot therefore be less than 4,80,000, and these I imagine will be nearly one-fifth of their families including old people and children, which will make the agricultural

population 24,00,000. Now, considering the very imperfect state of agriculture, and the rudeness of the arts on this district, I do not think that we can add more than one-fourth of this number for all the other classes of society, specially as a quantity of grain is exported. This will give 30,00,000 for the total population, being about 558 persons for each square mile.

Secondly. An estimate may be formed from the quantity of rough rice, after deducting seed, that I have calculated to be annually raised in this district, is about 368,00,000 muns, which according to the trials that I made will give 276,50,000 muns of clean rice. Now I have supposed, that to the value of 32,00,000 rupees of rice, or 44,00,000 muns are exported, and there will remain for consumption 232,50,000 muns Calcutta weight. Then allowing $\frac{1}{2}$ seer of 96 Sa. Wt. for each person daily, which is the calculation usually made in this district, this quantity of rice will feed more than 40,00,000 of people; considerable deductions however must be allowed for grain that is wasted, distilled, consumed by fire, eaten by cattle, and used in the arts; but still this population seems to be exaggerated, and the calculation founded on the number of ploughs seems more suitable to reality.

The most remarkable circumstance is, that with this overwhelming population, there is a general complaint of a scarcity of workmen. The waste lands are attributed to a want of farmers; and common workmen or porters cannot be procured without the utmost difficulty.

The difficulty in procuring farmers for waste lands, I imagine, is owing to the extreme poverty of the generality of that class of men, who have no farther means than will just enable them to cultivate land that is in good condition, and from which they can receive an immediate and certain return; while the immense profit, which those who have any capital make by lending out their money to necessitous neighbours, prevents them from laying out money on improving the soil.

The difficulty of procuring workmen and porters proceeds, in my opinion, chiefly from the want of skill and of proper implements to facilitate labour, so that the quantity which individuals can perform is exceedingly small, and almost every person is therefore engaged. It must, however, I am afraid, be allowed that a want of energy and activity in the people contribute also to the same end.

That the population should be enormous is not wonderful; for there are not probably 1,000 persons born in the district who are in the army, or who have left it for service of any kind, or indeed who have at all emigrated, except scoundrels who are under the power of justice, or who have absconded from a fear of the law. These are indeed very numerous.

The notions of both Hindus and Muhammedans inculcate in the strongest manner the duty of women to propagate the species, and I may venture to say that the injunction is complied with, as far nearly as human nature will admit. A maiden at the age of puberty would be looked upon by the natives with disgust and contempt; but few indeed are left in this humiliating situation. Besides, the Muhammedan law, and that of three-fourths of the Hindus of this district, allows widows to live in a kind of left-hand marriage, which, although not so honourable as proper matrimony, is far from being considered as sinful or as excluding them from society. Accordingly, except prostitutes, I may safely venture to say, that in the whole district there are not 1,000 women capable of propagating the species, who are not in a situation of doing so, either as wives or concubines. Even among the pure Hindus, whose

APPENDIX III—*contd.*

widows cannot marry, there are comparatively few persons of that description; for most of them are from other districts, and a large proportion of their widows, who do not burn nor become prostitutes, retire to their families.

The hardships imposed upon Hindu widows of rank will be seen from many circumstances in the following account. They are stripped of the numerous ornaments which they enjoyed while children and wives, and are not even allowed to wear a red border to their dress; while they are compelled to sleep on the ground exposed to insects and vermin, and to act as menial servants to the vain beauties who are decked out in the ornaments of which they have been deprived. Women of a high mind often prefer the funeral pile, while many others submit with patience, especially in the families of landholders, when they have young sons totally incapable of managing their affairs; but it is not wonderful that many young women, conscious of their beauty, and thoughtless concerning its decay, scorn to submit to such harsh regulations, and seek for refuge in the house of a bawd.

In fact, the rage for marriage is such, that a man, who has not money sufficient to defray the expense of the ceremony is every where willing to borrow it at any interest; and this involves himself and offspring in difficulties, from which death alone can relieve them. In some divisions I found, that even common labourers sold their services for from 18 to 24 months, in order to raise at once a sum sufficient to enable them to marry; and during that time, the wife of course is left to provide for herself in the best manner she can. The master in such cases finds the servant in food and raiment.

It may seem surprising, in a country where procreancy has such encouragement, and where perhaps there is less emigration than in any place whatever, that the species should not multiply so fast as to render famine common, or that a single inch of ground should remain unoccupied.

I have already endeavoured to account for part of the lands remaining waste from poverty of the farmers, and the high profits on capital. With respect to the supply of food, I must state, that in the remembrance of man there have only been two famines; one in the Bengal year 1177, and one in the year 1191, the one 55 years, and the other 38 years ago. Both these were owing to very unfavourable seasons, when a great part of the crop failed; and in the latter it was only in some parts of this district that any considerable number perished. In common years, or even in times of scarcity such as the present year 1808, such excess of misery is unknown; and none, so far as I could learn, perish of hunger: on the contrary, there is usually a great abundance of food.

There seem to be two principal means that keep the population within the bounds of subsistence; one is early marriage, and the other disease.

In all the larger animals nearly resembling man, with whose manners we are well acquainted, such as the horse, ass, cow, or sheep, it has been found, that where the sexes have been allowed to unite so soon as actuated by desire, the offspring was puny, and the operation uncertain; and I think we may safely extend the analogy to the human race. Some peculiar tribes of men in India, especially those in the western parts, and the bearers of palanquins, are no doubt strong men; but it is not within my reach at present to form a rational conjecture concerning the reason why these differ from their countrymen. It suffices to say, that the inhabitants of Dinajpur are a puny, weak race, and are far from having numerous families, notwithstanding their early marriages, which on the woman's side almost always are consum-

mated before the age of 13 years, and on the man's, very commonly before the age of 16. In the families of landholders, it is very uncommon to trace three successive generations; and in order to preserve the succession recourse must be had to adoption, more usually after one regular succession than after a longer interval. These land-holders are all married when children, and enjoy an abundant diet, comfortable dwellings, and plenty of warm clothing. It may indeed be with justice said, that the villages of Dinajpur swarm with children. This however I believe does not proceed from the prolificness of individuals, but is the natural consequence of the people being unhealthy and shortlived, which of course requires a large proportion of children to the number of adults. The moralist, who with a view of checking vice, should succeed in introducing early marriages, would, I am persuaded produce great injury. The breed of men would not only degenerate, but vice would become more predominant. Female beauty reaped too early almost instantly decays, disgust soon follows, and the husbands, like the land-holders of Dinajpur would soon abandon themselves to intrigue.

§ 1000 :

The grand check however to the excess of population is disease, which makes ample room, and fever annually sweeps away immense numbers; although I do not think that any means would ever render Dinajpur a country remarkably salubrious, yet I am persuaded, that the excessive prevalence of fever is more owing to the want of stimulating diet, and of comfortable lodging and clothing, the consequence of poverty, than to any extraordinary degree of malignity in the air; and the great poverty of the natives is no doubt to be chiefly attributed to their improvidence, especially in forming early marriages, by which they have been involved in debt. The fevers are generally of the remitting kind, and terminate fatally in a few days; but more commonly they terminate in agues, or commence under that form, and are accompanied by enlargements of the spleen and dropsical swellings, which carry off the sufferer after long confinement. In fact, there are few who escape with less confinement than one month in the year, and the whole are a sickly, poor looking people.

The fever makes such ample havoc, that little room seems to be left for other diseases, some of which however are objects of great curiosity. I was perverted from gaining a proper knowledge of them, partly by my constant travelling, and numerous other avocations, which, were incompatible with an attendance on the sick, and partly from my having met with no native physician. The practitioners of medicine are confined to Dinajpur and Maldeh and were so much engaged, that I could not procure an interview of length enough to afford satisfactory information.

The small-pox on the whole does little injury, and the inoculation for that disease is pretty generally diffused. The inoculators are of both religions and of all castes. One of them, a Hindu, gave me the following account of his plan. Every year, so soon as the natural disease appears, which it usually does between the 10th of February and 12th of March, he begins to inoculate, and the season for inoculation continues until the 12th of May. Some years the spontaneous disease does not appear, and then he cannot operate, having no means of procuring matter. The inoculator in the course of his practice remembers this having happened four times. When he has found a person under the natural disease, he opens the pustules with a rude iron bodkin, and collects the matter on some cotton wool. It will keep three days, and no longer. He uses it by moistening the cotton in water, and rubbing it on the skin, and then in that part he makes eight or 10 punctures with a needle; afterwards he rubs the impregnated cotton upon the punctures. Children are not inoculated

APPENDIX III—contd.

under three years of age, but generally before ten. Those who are too young for inoculation, are carefully separated from those who undergo the operation, and are made to drink sugar and water, over which some incantations to Sitola have been performed by a brahmin. Previous to the operation, the child is washed, and afterwards is not allowed to eat fish: meat is nearly out of the question, but it seems to be allowed whatever else it chooses, except cakes of bread; and sugar, plantains, water-melons, cucumbers, and cold boiled rice are recommended as the most proper diet. Two or three times a day it is washed in cold water. Should a fever accompany the eruption, the inoculator repeats a spell (*Montor*) over some water, which he gives to the child to drink. He knows of no other remedy, and his skill is supposed to consist in the knowledge of a proper spell, which is a secret Muhammadan inoculators, as well as Hindus, pretend to a knowledge of. Very few indeed of those who are inoculated die, even in the worst seasons; for although the disease appears naturally almost every year, there are certain seasons, once in 10 or 12 years, when it attacks more generally than others, and it then proves uncommonly fatal. In such seasons, there dies perhaps one in a hundred of those who are inoculated. It is indeed chiefly in such seasons, that the spontaneous disease proves fatal to the natives of Dinajpur.

The inoculators, when not employed in the line of their profession, cultivate the ground with their own hands. Their fee is from one anna to one rupee for each child, according to the circumstances of the parent; and they are by no means respected, nor considered as on a footing with the practitioner of medicine.

The vaccine inoculation is totally unknown to the natives, even by report.

Measles appear occasionally, but are seldom fatal. Fluxes and choleras are common in spring and rheumatisms in the cold weather; but these seldom kill.

The pox is rather uncommon; and except near the town, married men are ashamed to infect their families. In and near Dinajpur indeed, it is supposed that one person in four has this disease. Neither can the itch nor ring-worm be considered as very common, and they do not affect more perhaps than one-fourth of the people, and these of the lowest ranks, which in India must be considered as a very moderate proportion. The ring-worm is the most prevalent.

These diseases are common to natives of Britain and India, but there are others peculiar in some measure to the latter, which deserve particular notice.

The kind of leprosy, called *Kushtho*, of *Mohavyadhi*, (that is, the great disease) is common, although not quite so prevalent as in some parts of Bengal. Some estimate the number affected at one in the hundred, while in other districts not more than one in 500 are supposed to suffer. I am doubtful whether or not it has yet been described by nosologists, or at least clearly distinguished from some diseases to which it has a strong resemblance; but not having it in my power to consult the work of Sauvages, I cannot speak positively. In this terrible disease, the skin becomes wrinkled and discoloured, the joints of the hands and feet drop off, and the patient becomes a most loathsome object. It has no tendency to spontaneous cure; but continues to afflict the patient until death. I am certain that it is not infectious; so that in several points it seems to differ from the leprosy to which the Jews were subject, and which I believe is that called *Lepra Arabum* by nosologists. I have known women, who had laboured

under it for years, and who had healthy children, which they suckled, without communicating infection; and I am here assured, that men labouring under it have for years cohabited with their wives, who have continued exempt. It is reckoned however hereditary, and I believe with justice; but it seldom makes its appearance before the age of puberty. By the natives here, it is reckoned of two kinds: *Popoj*, which is inflicted on those who are great sinners, and which may be cured, if the gods please, by a pilgrimage to Baidyonath, near Jaggira, on the Ganges; and *Kormoj*, which is inflicted on those who have been sinners in a former life. Were it not for the overbearing credulity of the natives, one might from thence infer, that the disease sometimes goes away spontaneously; but after much inquiry, I have not been able to learn of one case. It seems in Bengal to occupy the place of scrofula being nearly as common as that malady is in the colder parts of Europe. In a native of India, on the contrary, I have never seen a clearly marked case of scrofula; and believe such have rarely, if ever, occurred. I know from repeated trials, that arsenic is no cure for this leprosy, as has been pretended; and I have also tried mercury in vain. Neither had a full and nourishing diet any better effect in a fair trial, which I made by order of Lord Teignmouth, when that nobleman was Governor General. Mr. Halliday, surgeon at Dinajpur, informs me that he had had some success with the mineral acids.

The leprosy, in which the skin of the native becomes white (*Sutric*) is but rare, although at all times there are several examples of it in the district; and a similar state often probably takes place in the skins of Europeans, without being observed or considered as a disease. At least I have seen the skin of some Europeans, that exactly resembled those of the Indians who are affected with this disorder.

The leprosy, accompanied by an enlargement of the leg, and which has been called elephantiasis by nosologists, has been often considered as a mere symptom of the first mentioned disease. The natives, I believe, with great justice consider them as perfectly distinct; and the disease which consists in a swelled leg they call *Godh*. In Dinajpur it is not a rare disease, and in some divisions it was said that one person in 200 labours under it, but in others, it is not so common. It generally commences in adults, and is accompanied by repeated attacks of pain and fever, which the natives say appear always either at the full or new moon. Each attack of fever is accompanied by an increase of swelling; but when this has enlarged to a certain extent, the attacks of fever gradually become less and less violent, and produce less and less effect on the swelling; so that afterwards the patient enjoys good health, lives to the usual age, and suffers no inconvenience except from the size of the tumour. Both sexes are subject to the three diseases that have been last mentioned.

The women, in a few parts of this district, chiefly near the Punabhoba and Atrayi rivers, are subject to the indolent swelling in the throat, which seems to be exactly the same with the goitre of the Alps. By the natives it is called *Gologondo*, and its progress is nearly the same with that of the *godh*; but the fever and pain are never so considerable, and the former is often not perceptible; while it is increasing, however there are always slight paroxysms of pain. No remedy is known for either of these diseases.

The male sex in this district, as well as in other parts of India, are subject to a swelling apparently of a similar nature but which affects the testicles. Its paroxysms of increase are accompanied by fever and pain, which last three or four days, and are said always to appear at full or new moon. It seldom attacks persons under

APPENDIX III—*contd.*

20 years of age, and usually commences on only one side. In this stage, it is called *Eksira*, and sometimes is cured, but when both the sides are affected, especially after a few paroxysms and after it has acquired the name of *Korondo*, no remedy is known. After some time, the paroxysms of pain and fever entirely cease, and the swelling becomes stationary; but it is extremely inconvenient from its size, and frequently destroys the powers of generation. It is not, however, liable to degenerate into cancer, nor to affect the general health. The usual size is, that of a man's head, but it is often much larger. The natives consider these three last diseases as a species of the same genus, and I believe with perfect accuracy. This last species is not so common in Dinajpur as in the southern parts of Bengal, but still many are affected.

Two febrile diseases, accompanied by local inflammation, are also exceedingly common, but are not epidemic. The one is by the natives called *Sannipatik*, and is a swelling and pain of the submaxillary glands, accompanied by fever. It frequently attacks the same person at different times, in the course of his life. This disease is very common in Dinajpur, and Mr. Halliday considers it as the same with the mumps (*Angina parotidea*) and treats it with emetics. I cannot say that I am entirely satisfied concerning the identity of the two diseases. Many of my followers suffered from it, and some more than once; but it was a mild complaint, without any symptom that required so active a medicine as an emetic, otherwise I should have tried the plan recommended by Mr. Halliday.

The other disease is very common in every part of India, and by the natives is called *Nasa* or *Nakra*. It is a considerable fever, accompanied by much drowsiness, and by general pains, especially in the neck and shoulders. The inner membrane of the nose is considered by the natives as the seat of the disorder; but there is no considerable uneasiness in that member. The membrane is however turgid with blood. The cure applied by the natives is to draw blood from the part, by thrusting a sharp-edged grass into the nose. So far as I have had occasion to observe, the disease would readily terminate in health, without assistance; some persons however pretend to have great skill in knowing the proper time for introducing the grass, and say that then the disease is ripe.

IV

Estimate of the expense of a Hindu family of high rank and station in the town of Dinajpur. It consists of the master, who is married and has one child; of a dependent relation, who is also married; of another male dependent relation who acts as steward, but his wife does not live in the family; of a widow, who acts as cook; of two men servants, and a boy or woman domestic; in all 10 persons.

LODGING

	Rs. As. P.	Rs. As. P.
To a small house, built of brick, 14 cubits by 7, usually divided into two apartments, with wooden doors and some small windows having wooden shutters. In this the master with his wife and child sleep and eat, .	300	0 0
To a hut, 8 cubits by 6, made of bamboo posts and beams, the walls of clay or of hurdles, the door a hurdle. In this the male relation and his wife sleep, .	10	0 0

	Rs. As. P.	Rs. As. P.
To another hut of the same kind, 10 cubits by 7, which serves as a kitchen; and where the widow sleeps; if made of hurdles it is plastered with clay, .	15	0 0
To a hut like the last, which serves for a store-house, and in which the boy or woman servant usually sleeps, .	15	0 0
To 3 huts of the same kind, but small, and their front only plastered; one serves for a temple, the other two for accommodating strangers, whether friends or religious mendicants, .	25	0 0
To a hut, 12 cubits by 8, placed near the gate for receiving company (<i>Batlok-khana</i>). It is usually made with a wooden door, with walls of mats, in which there are some openings by way of windows, that may be shut by hurdles which fall down (<i>Jhangh</i>). In this the steward and servants usually sleep, .	30	0 0
To a hut for the cattle, 8 cubits by 6. This is not plastered, .	10	0 0
To a house, 10 cubits by 7, for the watchman, and through which is the entrance, with a mud wall, which surrounds the premises, and which includes about 1½ bigah (¾ acre) planted with trees and flowers, .	35	0 0
Total, .		440 0 0
Interest, insurance, and repairs on the amount, at 36 per cent. a year, .	158	6 5
Ground rent, .	6	0 0
Total lodging in expensive families, .		164 6 5
Very few people however occupy such a house. In place of a brick apartment for the master and mistress, the usual accommodation is thatched, but the beams and posts are wooden, and the walls are plastered with mud. Many houses of this kind have two stories, but such are seldom inhabited by decent persons, and are chiefly appropriated to prostitutes. A house of this kind costs Rs. 60, which reduces the whole amount to, .	200	0 0
Interest, &c. on the amount, .	72	0 0
Ground rent, .	6	0 0
Total usual lodging, .		78 0 0

APPENDIX III—contd.

Furniture of a durable nature, for the temple				Rs. As. P.	Rs. As. P.		Rs. As. P.	Rs. As. P.		
1 pair of copper cups, for pouring water on the gods, (<i>kosha kooshi</i>),				3	0	0	5 brass and 5 bell-metal <i>Kotoras</i> , or small cups,	5	0	0
1 copper <i>kundo</i> , another kind of cup used in prayer,				2	0	0	2 brass <i>bohuguna</i> , or pots for boiling rice,	4	0	0
1 copper <i>tat</i> , a kind of plate used in prayer,				1	8	0	2 brass <i>hanri</i> , pots for making curry,	4	0	0
1 copper <i>pushpopatro</i> , a plate for holding flowers, used in prayer,				3	0	0	1 brass <i>hata</i> or ladle, and 1 <i>bayuli</i> or hook for removing pots from the fire,	2	0	0
1 brass <i>pudmason</i> or salver,				2	0	0	1 brass spitting pot (<i>dabor</i>),	2	0	0
1 brass <i>tripodi</i> , or tripod, which supports a shell or <i>saweer</i> (<i>Panisongkho</i>), containing holy-water,				6	0	0	1 brass lamp-stand (<i>pilsooj</i>),	5	0	0
1 brass lamp with five lights (<i>Ponchoprodip</i>),				1	8	0	1 brass mortar and pestle,	6	0	0
1 bell-metal <i>kangsor</i> , or bell in form of a plate,				2	0	0	2 pair of betel salvers (<i>pambata</i>), one of brass, the other of bell-metal,	8	0	0
1 bell-metal <i>ghonta</i> , or common bell,				2	8	0	2 pair of betel-nut cutters,	0	8	0
2 brass pots (<i>apkhora</i>), for holding the water that is to be offered,				2	0	0	1 brass implement for smoking tobacco through water (<i>hooka</i>),	8	0	0
2 brass plates (<i>rikabi</i>), for holding fruits and sweetmeats as offerings,				3	0	0	1 <i>albala</i> , another instrument for the same purpose, with a long flexible tube such as is used by the Europeans in India; it is made partly of copper and partly of other metals,	21	0	0
1 conch-shell, for blowing to attract the deity's notice,				3	0	0	2 iron (<i>khuli</i>) frying pots, used also for boiling milk,	4	0	0
1 <i>chotudla</i> , a wooden table or altar, on which the images are placed,				4	0	0	2 hoes and 2 hatchets (<i>kooral</i>),	3	0	0
1 <i>chondonpata</i> , or stone rubbing Sandal-wood to dust,				0	8	0	1 <i>khonta</i> , or wooden stake pointed with iron, used as a spade and pickaxe,	0	4	0
1 <i>ason</i> , or small woollen carpet, on which the person who prays sits,				0	8	0	3 <i>bothis</i> or kitchen knives,	0	12	0
Total of furniture for the temple,						36	8	0		
FOR THE HOUSE. Pots of various kinds for holding water; viz.							3 sickles (<i>kastya</i>) for cutting grass for cattle,	0	6	0
4 brass <i>kolos</i> ,				24	0	0	1 iron rod for cleaning the <i>hooka</i> ,	0	1	0
3 ditto <i>garu</i> ,				8	0	0	2 knives,	0	8	0
3 ditto <i>lota</i> ,				5	0	0	2 pair scissors,	0	4	0
3 bell-metal <i>apkhora</i> ,				5	0	0	2 bills for cutting bamboo or wood,	0	6	0
3 brass <i>omriti</i> ,				3	0	0	1 iron ladle and an iron hook for removing pots from the fire,	0	8	0
6 brass and 4 bell-metal <i>thal</i> , or plates,				20	0	0	1 brass or iron pot for holding oil, and a handle for the same for a torch,	3	0	0
6 brass and 4 bell-metal <i>bati</i> , or large cups,				10	0	0	1 hanging iron lamp,	0	4	0
							10 stone plates and 5 stone cups,	13	0	0
							1 stone for grinding curry-stuff,	1	0	0

APPENDIX III—contd.

	Rs.	As.	P.	Rs.	As.	P.		Rs.	As.	P.	Rs.	As.	P.
A palanquin (<i>Yan</i> or <i>Jan</i>), .	20	0	0				4 large calico sheets, which cover the floor of the sitting apartment, .	6	0	0			
1 (<i>toktaposh</i>), a kind of large sofa, made entirely of wood, and more perhaps resembling the bench in a guard-room, where people can both sit and sleep. It stands in the place where company is received, .	4	0	0				1 large pillow and two smaller for leaning the back against, while sitting on the floor as usual, .	4	0	0

V FAUNA

With the exception of fish, the animals that are found in this district, are of little importance.

I observed only one kind of monkey, which has a tail that reaches below the knee, but not to the heel, and is called *Morkot* by the natives. Its hands are black, and the callosities on the buttocks are brown. When old, the face and buttocks become red. It seems to be the *Simia Rhesus* of Audibert and the *Macaque a queue courte* of Buffon. The younger animal, the face of which is not red, seems to be the *Patas a queue courte* of this great naturalist. In the district of Dinajpur monkeys are neither numerous nor very troublesome. Those that I saw, were in the woods near Peruya; but I was told, that the greatest number is to be found near Nawabgunj. They assemble there on the banks of the Korotoya, and collect the fruit of Singgur (*Trappa*). According to the natives, after having procured a quantity, the monkeys divide the spoil, and bathe; and then each eats his share. This is probably an idle story, such as are usually current concerning the manners of different animals.

The wild elephant and rhinoceros can scarcely be said to be known. Two wild elephants certainly made their appearance in the forests of Peruya in the year 1806, and remained there a rainy season. They were seen by many, and are said to have killed some people,

who straggled near them. It was supposed, that they were accompanied by a rhinoceros, for what reason I cannot say; as this animal, so far as I could learn, was not seen, and does not usually frequent such company. The elephants had probably wandered from Morong. A thousand idle stories were immediately circulated. It was said, that they were actually elephants which had belonged to Bhim Raja, the son of Pandu, who lived about 5,000 years ago. Two elephants to a multitude of people, who chose to assemble and attack them, are not at all formidable, and these invaders ought to have fallen an easy prey, had the people been led to the attack; but no officer of police nor landholder took any pains, and what is every one's business is commonly neglected. They were allowed to ravage at pleasure, and occasioned great dismay so that several villages were deserted. The only step taken was a grand sacrifice, to which even the Moslems contributed. Twenty or thirty brahmins received a sum of money, and performed a grand ceremony which was effectual, as the dry season approached.

The jackal and Indian fox (*Canis Bengalensis*, Pennant), are very common, but harmless. I heard of no wolves nor hyenas.

Tigers and leopards are not numerous; as they therefore have an abundant supply of food, from the cattle which feed in the woods, they very seldom attack men. Although they frequent the neighbouring forests, and even the streets of Ghoraghat, the people walk alone through both, even at night; and I heard of only one person in the whole district, who had been killed in the course of the year. It was in this district, that a white animal of this kind was killed some years ago, the skin of which having been sent to Europe by Lord Wellesley, occasioned a dispute, whether it was that of a lion or tiger. No such animal has been seen before nor since. Mr. Tucker, an Indigo Planter of this district, declares, that in a wood near Lalbazar, he saw an animal resembling a tiger in size and colour, but it had a mane like a lion. I offered a considerable reward for it, dead or alive, but without success; this however is no proof of its not existing, as I found the people totally unwilling to bring even fish plants, or any other natural production. At Ghoraghat I heard of a small spotted animal of the cat kind, called Nakeswari, which is said to be common in the neighbouring woods, where it lives on trees. No offer of reward could induce the people to bring one. This perhaps may be the *Cerval*, an animal which I have never seen. I have not been able to learn that any where in India there is such an animal as the panther.

The Indian ichneumon is very common, but is seldom tamed. Otters are so numerous, that their fur might become an object of commerce, but there is no person here who understands the method of taking them: so far as I can learn, it is practised by the people of Dhaka alone. Bears (*Ursus labiosus*, B.) are not numerous nor destructive, and are found chiefly in the ruins of Peruya.

Where the soil is loose and sandy, the common porcupine is abundant, and even destructive; as it prevents the cultivation of turmeric and ginger. It may be eaten by Hindus of all ranks; and some that I had caught were disputed for with great eagerness by the people; yet these animals are seldom molested.

Rats and mice are by no means so troublesome as in Europe.

Hares are very numerous, and easily caught: yet although they are considered as pure food, they are seldom molested. When a man wishes to give a feast, he sends out some people with poles, who surround the long grass, and knock down as many as are required.

There are many deer in the vicinity of the Mohanunda, and of the lower parts of the Punabhoba and Tanggone; but scarcely anywhere else. They are so numerous among the long reeds and woods of these parts, that they are a nuisance by destroying the crops. I saw no kinds except the axis and porcum deer, and in this class of animals, the natives apply specific names so indefinitely, that I cannot follow them as guides. There are no hunters who make a profession of killing these deer, and of carrying the venison to market, although no one would hinder them. The neighbouring farmers keep nets, and occasionally hunt, partly to save their crops, and partly to procure animal food. I went twice with them, and on one occasion took two deer, and on the other had no sport. I was a good deal surprised at the method. The net is made of whip-cord, and may be about 6 feet wide, and each farmer brings a piece with him of 30 or 40 feet in length. All the pieces having been joined, they are set in a straight line, and are supported on one edge by poles, which incline towards the direction from whence the game is expected to come, and lean on forked sticks. Some persons then remain behind the poles with lances, to kill or seize the game, which comes into the net before it can disentangle itself. The others advance from the net in a line parallel to it, and beat the grass and bushes, and make a great noise. I expected, when they had set the net, that they would have gone in silence to a distance, and have roused the game as they advanced towards the net; but this they assured me, would not answer for the game always runs backwards in the direction from whence the noise advanced upon it. The game taken in these nets consists of wild hogs, deer, and tigers.

I saw no antelopes, but there may be some; as by the natives they are confounded with deer.

The wild buffalo, exactly of the same kind with the tame, is very common, and exceedingly destructive, nor has any considerable exertion been ever made to free the people from this evil. The animal is too formidable for individual effort to produce any good, and the property of the landholders is so much intermixed, that the endeavours of any one of them would have little effect, provided his neighbours contributed nothing. Many indeed are said to levy money from their tenants under pretence of hiring armed men to kill these animals, but very few hunters are employed. I inquired every where after such people, but could find none except in two or three places, some of whom were employed by the judge. Unless the destruction of these animals becomes an object of police, and unless the expenditure of the money raised, be carefully checked, no hope of success can be entertained. I have indeed great doubt how far any exertion will be entirely sufficient, unless the woods and reeds which give them shelter are removed. The wild buffaloes usually go in small herds, and may be easily killed by means of musket or poisoned arrows. These are the only effectual means for destroying the breed altogether; but others are employed for procuring the animals; for the flesh is eaten both by the Muhammedans, and by the lowest tribes of Hindus. They are sometimes caught in pitfalls, or by a noose suspended between two trees; but they are a shy, sagacious animal, not easily deceived. The natives near the lake at Bamon-gola, when they find a herd swimming, attack it with boats or canoes, and having seized on the hindmost buffalo by the tail despatch him with a large knife. In the same vicinity the keepers of tame herds are said to be sometimes able to secure wild males, by means of trained females, which surround the male until a keeper comes up, passes a rope through the septum of his nose and then the females push him towards a tree, where he is fastened until tame. The bulls thus caught are reckoned more valuable than

APPENDIX III—contd.

such as have been born in the domestic state; but I believe the practice is very uncommon: I heard of it only at Bamongola.

The wild hog is by far the most destructive animal in the district, although never of a size to be formidable to the villagers, if armed with pikes. Near many woods they are almost innumerable, and in some places seem to be gaining ground. All that I have said concerning the destruction of the buffalo is applicable to that of these animals; and it seems an object worthy of the most serious attention from the police; circumstances should direct whether it would be most advantageous to make a general hunt, or to levy a contribution with which regular hunters may be hired. I should in general prefer the former, because at convenient seasons all persons may turn out, for a day or two without inconvenience; and because it can never be the interest of the regular hunters to extirpate the animals. The wild hog is often hunted by the low Hindus for food. He is sometimes caught in nets like deer; at other times he is pursued with common curs of the country, which run round him barking, and thus keep him at bay, until their masters come up, and dispatch him with arrows or spears.

Porpoises are pretty numerous in the large rivers but are not applied to any use.

No birds are caught for being trained to sport. At present indeed it may be said, that the natives have no turn for any of the amusements of the field. A late Raja spent vast sums upon it, but almost all the people, whom he employed, have disappeared.

There are no paroquets nor birds that are commonly caught to be tamed; and except about Malda and other places of much trade, few tame birds of this kind are kept, which must be considered as a comfort to those who have been annoyed at day-break, by fellows hawling to a miserable paroquet, what they call the name of God, as is very common in Bengal.

Although the country swarms with water-fowl, both web-footed and waders, the natives derive from thence little or no resource for their tables. The common wild goose (*anas anser*) is exceedingly abundant in the cold season, and remarkably good, but is never used; and there is a great variety of ducks and teals, with abundance of snipes, that are equally neglected. When a very extravagant man, at Dinajpur, wishes to give a feast, he hires some people to catch birds with a rod and bird-lime. Those that are preferred are three birds of the cormorant or shag kind, called by the natives *panikuori*; several small herons included by the natives under the general name of *vok*; several birds of the Jacana and Gallinule kinds, included under the native term *Jolpinani*, but above all the common house sparrow. This indeed being considered as possessed of aphrodisiac qualities, is in request at all times.

The peacock is very common in the woods, and in many places so numerous, as to be destructive to the crops; but on the whole, the people of this district have little to complain of the feathered tribes, and neglect the luxuries of that kind, which nature has poured forth in abundance.

Several kinds of tortoise are more eagerly sought after, but to European taste they are execrable. Frogs are not eaten by any of the natives, but some lizards are used in food, especially one of which I have sent a description to the India House, and which is called the *Suarao Godhika*. The crocodile is common both in rivers and tanks, but few accidents happen from his violence.

At the season when I visited the district, serpents had retired into holes in the earth, and were very rare-

ly seen; but in the beginning of the rainy season they are driven from their lurking places, and fly for refuge into the huts and higher places near villages. At that time accidents are common, and a good many perish every year from the bite of these vile reptiles. They are supposed to be under the immediate direction of the goddess Bishohori. In the dangerous time many sacrifices are offered to her image, and people are employed to sing her praise to music. Many persons are supposed to know spells (*mantra*), that will cure the bites of serpents; and I was gravely assured, by both Moslems and Hindus of the highest rank, that they had known these forms of prayer tried with perfect success. Dundumab is one of the places most infested with serpents, especially with the different kinds whose necks swell and have what is called a hood, and all of which are exceedingly venomous. There are a few of the people called *Buadhs* who catch snakes which they tame, and who are supposed to be possessed of a charm, which prevents them from being bitten. The charm, I know, consists in a blunt rusty knife, with which they scrape out the animal's teeth; the fellows however possess great intrepidity in seizing these formidable reptiles, and great impudence and dexterity in deceiving the people.

Fish forming by far the greater part of the animal food consumed in the country, the fisheries deserve particular notice. The demand being very considerable, and the supply being rather scanty, there is none exported, and salt is too expensive to admit of its being used in curing fish. The whole fish caught are therefore consumed in the country, and none are imported. During the rains the catching of fish suffers, for the animals have then such an extensive range, that they are not easily caught; but as the inundation subsides, and when the fish are confined within narrow bounds, they are easily secured by various simple means which the natives employ; and a very large portion of those taken are secured, when they may be said to be almost left sticking in the mud, or by means, that in most countries would be quite ineffectual.

The most simple method, when a pond, ditch, or marsh has become nearly dry, and the fish of a large space have been collected into a small pool, is to divide it by dams of mud and then, having thrown the water from each successively, to catch the fish as they are left dry. This is usually practised by all the poor labourers, especially in the ditches and pools near the rice-fields, which are not let to fishermen by the landholders.

It must be observed, that in about six weeks after the rainy season commences, every rice-field, although quite dry and hard in spring, abounds with small fishes. They are certainly most numerous near rivers and marshes, from which they in general come; but I am inclined to think, as I observed in Mysore, that the eggs often continue dry in the field, and are hatched after they have been moistened by the rain. The natives account for their appearance in such places by supposing, that they fall from heaven with the rain. The clerk (*mohurrer*) of the division of Rajarampur assured me, that he had often seen them leaping among the grass, as the shower fell. In fact, a person, who is well disposed, can see any thing like a very good Danish naturalist, who imagined, that he saw a fish gravely walking up a tree, for he had been assured by the natives, that such was its common practice.

The kinds of fish taken are very various, and mostly very small. There is no large like an extensive fishery of any one kind, except that of the *ilish* in the Mohan-onda, which I have just now mentioned. On all other occasions, among 100 fish taken there will be 20 different species. Although the last system of this part of Natural History, published by M. Laccpede, is extre-

APPENDIX III—contd.

mely valuable, very few of the fishes of Bengal are described in it. I must therefore content myself, for the present, with reducing them to his genera, although I have spared no pains in procuring descriptions and drawings of these interesting animals. The names vary a good deal in different rivers, even of the same district. I begin with a list of those I found in or near the Atreyi at Potnitola.

- 1—Tengpa, *Tetodon*, a bad small fish, reckoned impure by the Brahmins.
- 2—Vam, *Macrognathe armé*.
- 3—Gongti, *Macrognathe aquilonne*.
- 4—Gongor Gangti, *Macrognathe*, good fish resembling eels in taste.
- 5—Baliya, *Gobié Eclotre*? a small but good fish.
- 6—Kholisha, *Trichopode*, a beautiful small fish.
- 7—Gogul, *Ophiocephale*.
- 8—Gorovi, } *Ophiocephale*, karaway.
Bhorovi.
- 9—Cheng, *Ophiocephale*.

Much used by the natives, but very indifferent eating. The last, being extremely tenacious of life, is often found wriggling from one pool to another, when there has been a heavy rain. It is one of the kinds which are supposed to fall from heaven with showers of rain.

10 Koyi, *Lutjan grimpew*. This is a fish very much esteemed by the natives, and one of those supposed to fall from heaven. They also have a fable of its being able to climb a cocoanut tree. It is with the utmost astonishment, that I perceive M. Lacepede was carried into this error by a foolish account published in the Linnean Transactions. I should rather have classed this fish with the *Holocentres*, and M. Lacepede has probably taken his account entirely from the before-mentioned source. The animal is remarkably tenacious of life, and I know can live a whole day without water. It is very well tasted, but full of bones; and is reckoned a restorative.

- 11—Chanda, *Centropome*.
- 12—Rangga Chanda, *Centropome*.
- 13—Nam Chands, *Centropome*.

These fish are very common; but are too small for being dressed in the European manner.

14—Bheda, *Holocentre*. This fish has a strong resemblance to the *Koyi*, in its external appearance, tenacity of life, and dietetic qualities.

15—Pongya, *Cobite*, a small fish, little esteemed.

16—Magur, *Macropteronote grenouiller*, an ugly fish, but very much esteemed by the natives, who consider it as very strengthening. I think it is far from being pleasant to the taste.

17—Kamachasinggi, *Silure Fossile*, a fish very much resembling the former in appearance and qualities. It is reckoned impure for Brahmins, who eat the other readily.

18—Poba, *Silure*, a small pretty fish of an excellent flavour.

19—Boyali, Keyali, *Silure*, a large ugly fish, which often grows to six feet in length. By the natives it is thought good; but does not suit my taste. The Brahmins consider it impure.

- 20—Labhuy, *Silure*.
- 21—Gagra, *Pimelode barbu*?
- 22—Rita, *Pimelode*.
- 23—Ari, *Pimelode*.

24—Vagari, *Pimelode*. Large ugly fishes; but though very good by most natives.

25—Gagot, *Pimelode*, a small fish with many bones

26—Vachu, *Pimelode*, a fish about the size of a herring, and considered as very good by the natives

27—Banspatari, *Pimelode*, a beautiful small fish, which from its shining colours and shape is by the natives compared to a bambu leaf.

28—Tengora, *Pimelode*, a pretty small fish, that the natives think very good.

29—Kangkila, *Esoce*, an excellent small fish.

30—Pangchok, *Esoce*, a very small fish.

31—Ghobol, *Muge*, a fish about a foot long, which swims with its eyes above water. It is very good to eat

32—Telar, *Clupea*, a fish about the same size and value.

33—Pholuyi, *Myste*, a fish about the same size and value

34—Chitol, *Myste*. This grows to a very large size and is a rich fine tasted fish, but the natives do not like it, because it feeds on dead bodies

35—Koroti, *Clupanodon*, a small fish of little value

36—Chela, *Cyprin*. This is one of a numerous tribe of Indian fishes, which resemble the *Cyprin clupeoide*. It is very common in every part of Bengal, but is of little value

37—Elangga.

38—Sangpuyi.

39—Dangrika.

40—Debori.

41—Titpungti

42—Pungti.

These are all small species of the *Cyprin*, which are very common, and much used by the natives, but are very poor eating. Some of them are very beautiful especially No. 39 and 40. No 41 and 42 are the best for eating.

43—Sorol-pungti, *Cyprin Bulatmai*, a beautiful fish which grows two feet in length. It is not much valued

44—Kalbosu, *Cyprin*, an ugly black fish, strongly resembling the barbel. It grows often to a foot and a half in length, and sometimes to double that size. It is considered by the natives as good fish, and is both light, and well tasted; but it has many small bones.

45—Rohit, *Cyprin Rooce* of the English in Bengal. This is one of the most beautiful, of fresh-water fishes being finely shaped and elegantly adorned with green purple, gold, and silver, constantly varving one into the other. It thrives well in ponds but is best when found in running streams. The fish is much and deservedly valued, being light and well-flavoured. It is only inferior to the following in not being so rich. It grows to about three feet in length.

46—Katol, *Cyprin*, when taken from rivers with a good stream, this is perhaps the best fresh-water fish in the world; the body is white, light, and firm, and the head and belly are remarkably fat without being luscious or heavy. It grows to a very large size and weighs from 16 to 50 lbs. Though only a clumsy made fish, it is remarkably active and strong, and frequently springs over the net with great violence. Its colours are not remarkable for beauty.

47—Kuchiya, *Unibranchaperture*, an eel, as good as the kind common in Europe. The natives reject it from its near approach to a serpent.

APPENDIX III—contd.

Besides these I observed many other fishes in the district, especially the following:

- 48—Khoskhosya, *Muge*, a small fish of little value.
- 49—Dari, *Cobite*, a beautiful small fish
- 50—Korki-tengora, *Pimelode*.
- 51—Kavasi-tengora, *Pimelode*.
- 52—Ram-tengora, *Pimelode*.
- 53—Changrarmara *Pimelode*.
- 54—Uruya, *Pimelode*, a small fish of little value.
- 55—Silon, *Pimelode*, a large ugly fish, much used by the natives.
- 56—Chakunda, *Clupanodon*, a small fish of little use.
- 57—Ilish, *Clupanodon*. I have already mentioned the fishery of this species in the Mohanonda, which is almost the only river in the district that it frequents. This species is called Sable-fish by the English, and is the most important in Bengal. It has a strong resemblance to that called *la Fiente* by Lacepede, but has no teeth. During the floods it ascends in immense numbers to spawn in the Ganges and its larger branches, for 500 miles from the sea, and retires as the rivers decrease. It is usually about a foot and a half long, and is a rich, high-flavoured fish; in taste it resembles somewhat both the salmon and herring, to which last it has the strongest affinity. It is however rather heavy and difficult of digestion, and contains a vast number of small bones, so as to require much precaution in eating. These bones are destroyed, when it is cured with tamarinds, and the fish then becomes a very relishing morsel.
- 58—Peyoli, *Cyprin*, a small fish of little value.
- 59—Kursa, *Cyprin*. This sometimes grows to a foot and a half in length, but is little valued.
- 60—Hayali, *Cyprin*.
- 61—Tila, *Cyprin*.
- Two small fishes of little value.
- 62—Mirgal, *Cyprin*, a most beautiful fish like the Rohit, and almost as good; but it does not grow to quite so large a size, being seldom found more than two feet in length.
- 63—Khorki.
- 64—Bhanggona.

These are two beautiful fishes, somewhat between a carp and a mullet, as their lower jaw resembles that of the latter. They grow to about a foot in length, and are tolerably good to eat.

The crustaceous fishes are perhaps more valued by the natives of Bengal than the fish properly so called, and are excellent seasoning to eat with a food so insipid as rice. In some parts, especially near the sea, they are of many different kinds and sizes, from that of a shrimp to those which are larger than lobsters, for those that are mostly used are of the oblong kind, and are called by the generic name Chinggori. In almost every ditch near the Sea they are found in myriads; but in Dinajpur, except near the Mohanonda and the lower part of the Korotoya, they are very scarce. In the Mohanonda there are three kinds:

- 1—Jhingga, a small prawn.
- 2—Tengguya, a large prawn.
- 3—Mauho, a crawfish, which is often 15 inches in length, and as much in circumference.

Crabs frequent the fresh waters of Bengal, and are distinguished from the oblong kinds of crustaceous fishes by the generic name Kangkora. They are reckoned much inferior to the long-shaped fishes of this kind, and are indeed considered as impure by the higher ranks, who eagerly devour the others. In this district there are many crabs, but few of them grow

to a size that would fit them for a European table. They are chiefly found in the parts near the Nagore, Tanggon, and Punabhoba, that are entirely inundated in the rainy season. When the inundation retires, these parts may be observed covered with little heaps of earth, about a foot high, and eight inches in diameter, and in the top of each is a perforation. Under these are the lurking places of the crabs, which retire there for the dry season, and live in pairs. According to the report of the natives, these animals, as the water subsides, dig perpendicular shafts, about three inches in diameter and seven or eight cubits deep; and, when at that depth, they form a chamber about a foot in diameter, which contains water until the next inundation and in which a male and a female crab take up their residence. I attempted to dig several; but being too early in the season, the water always rose upon me before I reached the chamber.

Insects are not very troublesome in this district; at least from November until April, the season when I was there, scarcely observed any mosquitoes, although this is the season, when they are most troublesome in Calcutta. I was told, however, that in the parts of this district which are inundated these insects become almost intolerable in the rainy season.

The only wild insect which produces any thing of value is the bee, and it is the wax alone that is an object of commerce. Mr. Fernandez has rented the whole, except some portion of what is produced in Maldeh, and to each land-holder he pays a certain sum, which must be very inconsiderable, as the whole wax which he procures is said to be only 100 maunds, probably 70 or 80 per cent. Mr. Fernandez employs people in different parts to collect the wax; and these, who are called sirdars, employ servants to cut the combs. At Nawabgunj, which is one of the most productive districts, and which gives ten or twelve maunds each of 3,840 sicca weight, the people told me, that he allowed them 25 rupees for each maund, (about lb. 82) delivered at Dinajpur, and they had all the honey; but this is of little value. In other places, however, it was said, that the sirdars contract to give him a certain quantity of wax, and take the surplus and the honey for their trouble.

In this district there is only one kind of bee, which so strongly resembles the insect domesticated in Europe, that I should consider it as of the same species, were not its manners very different. The natives of India have no where tamed this industrious creature, and every kind, of which the honey is collected, is in Bengal usually called a honey-fly; nor could I discover, that the people had any appropriate name for this species. It frequents the forests in the rainy season, and in some districts the people employed in collecting the wax suppose, that the bees do not then build, nor live in society, but that they take shelter from the rain under leaves, and that a great part of them perish from the severity of the weather. This is probably a mistake, and is believed only owing to these people having never frequented the woods to look for the bees; for I found, that at Nawabgunj, a considerable part of the wax is procured in the woods, about the end of September, and must have been formed in the rainy season. Besides at Ghoraghat, that is the most productive district of which I heard, and yields near 30 maunds a year, most of the wax is gathered in the rainy season; and the people say, that then the bees breed, and live in society just as at other times. In the dry season the bees frequent the vicinity of villages, and form their nest on the branches of the neighbouring trees. Each nest consists of a single semicircular comb attached to the lower side of a horizontal branch by its diameter. One, which I measured, and which was said to be of the usual size, extended about two feet in radius. On each face is a series of cells, and in some parts of the comb there are

APPENDIX III—contd.

three rows, with passages conducting to those in the centre. The bees, when at rest, cover the whole surface of the comb. Near the villages they begin to build in November, when the cruciform plants, resembling mustard, that are cultivated for oil, begin to flower. In January, when they have brought up a brood of young, they eat the honey and desert their nest, which is collected for wax. In the middle of December, I examined a comb: the greater part of the cells were filled with young bees, a small portion was filled with honey, and a larger with a yellow powder, which the natives, I believe, justly consider as the food for the young bees, and as the pollen of various plants. The bees begin to build again in March, when most of the trees come into blossom; and having bred in June, they consume the honey, and retire into the woods. The combs formed at this season are the most valuable, and contain most honey. In order to procure this, the people chase away the bees, which is easily done by a little smoke occasioned by some burning husks of rice held under the comb in a basket that is made of a green plantain leaf. I saw this practised with great success before a multitude, who imagined that the wax-gatherer was possessed of a spell or prayers, which saved him from being bitten. A comb, such as I have mentioned, is said usually to give about a pound of wax, when cleared and melted; but those collected in spring are said to give 20 pounds of honey and wax.

There are several species of shells, chiefly snails (*Helices*), that are burned into lime, sufficient to supply the usual demand of the country, which is confined to the chewing with betel, to the white-washing of a few religious buildings, and to a small quantity used in manufactures. When any large building is to be constructed by a European, stone-lime is generally brought from Sylhet, but the natives prefer that made from shells. They of course must make advances long before the lime is wanted, to enable some poor people to collect shells in the dry season. Most are procured from marshes and old courses of rivers, where the water is stagnant.

VI PLANTS

A country so much cultivated as this district, is not favourable for the pursuits of a Botanist, neither was my journey through it performed at a favourable season. I have not much therefore to offer on the subject, especially as I found a great difficulty in procuring any satisfactory intelligence from the natives, who apply names so indefinitely even to the most common plants, that in order to avoid numerous mistakes great precaution is required.

Among the natural vegetable productions of most countries, forests constitute a valuable and most distinguished part. In this district, however, although not very extensive, the demand for their produce is so small, that forests may be considered as not only almost useless; but from their harbouring destructive animals, they ought to be looked upon as injurious, and therefore should be eradicated as soon as possible. By some unaccountable caprice the property of the forest is often vested in a person different from the owner of the soil. This person, although he has no legal right to prevent the owner of the soil from cultivating it, will of course take all indirect means of securing or enlarging his property, and none is so effectual as the encouraging the breed of destructive animals. In one division, I accordingly heard it alleged, that the keepers of buffaloes turn loose all the young males, and allow them to become wild.

The wastes (*jongol* or *bonya*) of this district may be divided into two kinds, one containing trees called here *katal*, the other contains reeds of various kinds, and is denominated from the species which is most predominant with the term *bonya* annexed.

The English call this kind of waste or forest by the appellation of grass-jungle. The proprietor, as I have said before, receives a very inconsiderable profit from both kinds. Those who want timber for building, or for the implements of agriculture, must pay a trifle for permission to cut a tree; and where there is a demand for the produce of the forest, a *bonkor* is appointed, who levies a small duty on those who cut fire-wood, thatch reeds, bambus, or the tree of which catechu is made. Other persons (*pholkor*) rent the wild fruits which are used as acids in cookery, for medicine, or for dyeing and tanning. Finally, other persons rent the duties (*kahachorayi*) that are levied on the buffaloes which pasture in forests.

The only people who can be called wood-cutters in this district are those employed for supplying manufacturers, and especially the Company's factories, with fuel. At Maldeh the fire-wood is cut by farmers, who live near the woods of Peruya, at times when they would otherwise be idle. Fifteen times a month a man cuts as much wood, as when green, loads four oxen, and brings it for sale. For the 60 loads he receives four Rupees, and pays a small monthly duty for each ox; the load does not exceed 1 maund of 100 ea. wt. the seer, or is about 103½ lbs. Avoirdupois. At Ghoraghat, each wood-cutter pays 12 annas a year.

The timber, which the woods contain, is little fit for building boats; and the poverty of the natives prevents them in general from using timber in their houses or even for fuel; so that almost the only demand for the wood in this district is confined to the making of a few small implements of agriculture a little coarse furniture, a few beams and posts for the houses of the more wealthy inhabitants, and to the supply of a little fire-wood for some of the Company's factories, Maldeh, Nichinta, and Shilboris, R (Maldeh, Nichintapur, and Selvorish). All the former of these purposes might be much better supplied from trees planted round villages; and the last would require only three small woods, provided these were properly managed, and regularly cut. A wood of a thousand acres would be fully adequate to supply the demand of any factory, if properly managed, and no encroachments were allowed. At present I have supposed, that about 220 square miles are under forests, woods or bushes.

Before this country was cultivated, I imagine that the lower parts were rendered almost impenetrable by thickets of reeds, while the high parts were covered with a forest consisting almost entirely of a tree, which is called here Sal or Gojal, and is well known by the former name to the carpenters of Calcutta. It has lately been described by Botanists under the name of *Shorea robusta*. In this district there remain several small forests of this tree, which indeed seems to spring up almost spontaneously wherever a dry soil has been left unoccupied: for the fruit, having wings, is carried far by the winds. In this district, however, the tree is not procurable of a size fit for sending to a distant market, and is chiefly of use for making ploughs and small posts and beams for the better kind of the native houses; and as it is a handsome tree, with very odorous flowers, it might be planted to great advantage round the villages, in the stiff clay soil, where it thrives. It is said, that in Morong, a resin called *dhuna*, is extracted by incision from this tree; but this is not practised in Dinajpur.

In this district, however, by far the greater part of the forests owe their origin to deserted towns or villages. The trees which grew round these have gradually increased, and have given shelter to some others that are not usually found in such situations. I shall therefore give a list both of the trees that usually grow round villages in this district, and that have found shelter among these in the woods, which have sprung upon ruins. I shall add the Botanical names,

APPENDIX III—contd.

so far as I know: but the list is far from exhausting the subject. In this place I shall also take an opportunity of mentioning the management of plantations; although, strictly speaking, that might be considered as a part of agriculture.

The bambu is the most common and useful woody plant in this district. The houses, furniture, boats, and implements of agriculture are entirely or in part made from this valuable reed, and it is the common fuel; so that it supplies all the purposes to which wood is applied in Europe; and is no doubt one of the principal articles of produce in the country; for, the annual value of the bambus that are cut cannot be estimated at less than 5,00,000 Rupees.

It grows from a creeping root, which extends from 12 to 20 feet in diameter, and sends up 40 or 50 stems. These form a clump that keeps separate from the others which are adjacent. Every year from 5 to 10 bambus of a clump are ripe and are cut, while young ones shoot up from the roots to supply their places. If the whole is cut at once, the plant is apt to die; and the stem perishes whenever it produces fruit, which very rarely happens in cultivated parts of the country. On this account, indeed, many of the natives believe, that the plant never produces either flower or fruit. When a new plantation is to be formed, a portion of the common root extending 2 or 3 feet in diameter, together with five or six stems, is separated from a clump. The tops having been cut away, this is planted in the situation where it is intended to rear a clump, and this begins to produce ripe bambus in about seven years. The plant requires to be exempted from inundation, and thrives best in a free soil. In this district, bambus according to their size, sell at from 1 to 3 Rupees a hundred; except at Dinajpur and Maldeh, where they are about 50 per cent. dearer; ground under bambus, therefore, in general gives a considerable return, and pays a high rent.

In this district the people have several specific names which, so far as I could judge, they apply with little or no accuracy. I could clearly however, distinguish four species, but there may be more; and I apply to these the names, that seemed to me the best ascertained.

1.—The most valuable kind seems to be called indiscriminately Boro Bans and Jauta Bans. It grows to the largest size, and is used for posts, rafters, beams, scaffolding, and whatever requires large dimensions, and it is the one most usually cultivated.

2.—The next species is also much cultivated, being that used for making all sorts of basket-work and mats. It seems to be indiscriminately called Makla and Jaoya.

3.—The Korongi is a small bambu that is not much cultivated. It is strong, but is chiefly useful for making some small implements of agriculture, or fences. It is often found wild.

4.—The Beru Bans, or thorny bamboo, is only cultivated about the monuments of saints as an ornament; for it grows very straight, and its branches are beautifully feathered, so that it has a very different aspect from the others. It is often found wild, especially in the woods near Maldeh and Ghoraghat. Its chief use is for making dry fences, or for the shafts of javelins or spears, for which it is remarkably well adapted; but it is also employed in the roofs of huts.

No account of any of these kinds has yet been published in the writings of any Botanist, to which I have access. This genus has indeed been much neglected, and its study is attended with numerous difficulties, even to those who are on the spot where they grow.

The same may be said of the useful plants which I shall next mention, the ratans or canes, concerning which Modern Botanists may be said to have published nothing that is useful in ascertaining the differ-

ent sorts. In this district there are two kinds which grow spontaneously, both in woods and near villages, where the soil is moist and very rich, two circumstances that appear necessary for every kind of this plant. Both are of a very bad quality.

5.—The one is called simply Bet, and its leaves resemble those of a cocoanut (*Folios æquidistantibus bifariis*). So far as I know, all the species, that have leaves of this structure, are proper ratans, and have slender stems fit for switches, or for being split to form baskets or wicker-work.

6.—The other called Gorol Bet has leaves like those of a date tree (*Folios sub-fasciculatis squarrosis*). All the species that I know, having such leaves, should be called canes, as they have thick stems fit for forming walking sticks, and are not used for the purposes to which the others are applied. The stems of these are often of an immense length, so as sometimes to be twisted into cables.

7.—Nearly allied to those is the Gaya or Guvak of the Bengalis, the *Arca* of Botanists. The plant seems to thrive in this district, but it may be considered merely as ornamental; for it seldom, if ever, brings its fruit to maturity, so that great qualities are imported. The reason of this seems to be, that it is not planted in groves which are sheltered by trees and hedges, and watered so as to preserve a constant moisture, which seems necessary for this palm. In the same latitude towards the east, where parching winds do not prevail in the spring, the tree thrives remarkably; and the same is the case in Mysore, where pains are taken to preserve moisture. Thus therefore seems an article, the culture of which may be readily introduced, and may annually save a large sum to this district. At present a few are planted among other trees, near some rich men's houses, merely, as an ornament, for which they are happily selected.

8.—The cocoanut palm, Narikel of the Bengalis, is nearly in the same state. I imagine indeed that it could with great difficulty be made to ripen its fruit.

9.—The elegant palm called *Caryota* by Botanists, and Ramguvah, or Bonkhejur by the Bengalis, is found growing spontaneously, but rarely, in the woods of this district, neither does it seem to thrive. It is applied to no use. In Malabar its stems produce a kind of sago, and its flowering shoot (spadix) yields a saccharine juice.

10.—The Khorjur or Khejur of the Bengalis has been considered as the *Elat* of Linnaeus, and is no doubt the *Katouel* of Rheede, which Linnaeus quotes as being the same with his *Elat*; but it is probable, that this great Botanist had some other plant in view, otherwise he would scarcely have separated it from the date tree (*Phoenix*). This valuable palm is not common in Dinajpur, but grows spontaneously, and thrives remarkably, and, could the inhabitants be induced to use its wine, might become a most valuable addition to their diet, as I have before mentioned, especially as it thrives on dry elevated places, such as are at present almost useless. Its juice may also be inspissated into a kind of saccharine matter.

11.—The *Lontarus* of Botanists, called usually Pal-mira by Europeans, and Tal or Triniraj by the Bengalees, is a still more elegant and useful palm, now totally neglected by the people of this district, except as an ornament like the former. It might become highly useful from its juice, and its stem is both a very durable material for building, and may be converted into small canoes, which in the rainy season serve to go from house to house. It thrives in this district, although it never grows spontaneously; and is finely adapted for covering the naked sides of tanks, which are now almost entirely useless.

12.—The Badam of Bengal (*Terminalia Catapa*, L.) is found in this district, and is a very ornamental tree. Its nut is however almost the only useful part; but, although remarkably light and well-flavoured, it is so incased by a hard shell as to be of little value. It does not grow spontaneously, and seems to have been introduced by Europeans.

13.—Nearly allied to the above, and having a nut equally good, is the Boyara, Bohora, or Bauri, of Bengal, the *Myrobalanus Bellirica* of Gærtner. It is a fine tree, grows to a large size, and produces a timber that the native reckon valuable. The fruit is used both in medicine and by dyers, and both the bark and fruit are used by tanners. Unfortunately, when in flower, the tree emits a most abominable stench, which perhaps should prevent it from being cultivated, as the demand for its produce is very small.

14.—The Horitoki of Bengal, or *Myrobalanus Chebula* of Gærtner, is not liable to the same objection; but its wood is not so strong, nor is its kernel esculent. Its myrobalan, or dried fruit, is however more used in the arts; and when the fruit, is preserved green in syrup, it is a valuable laxative medicine, which is much employed by the natives. Men, who have made a vow of chastity, and who are inclined to adhere to their resolution, endeavour to assist their virtue by eating this preserve, which is supposed to diminish the desires of the flesh. Were its growth encouraged near villages, in place of useless trees, the dried fruit might be procured in great quantities, and might become a valuable article in commerce; as I have no doubt, but that it might be employed in the finer kinds of tanning to great advantage. At present there is a sufficient supply for the demand of the district; and those who collect the fruit pay a trifle to the landholder.

15.—The *Tomex Japonica* of Botanists is found in this district and is a timber tree. It was shown to me as the Bijolghota, a plant used in medicine; but I have little confidence in the skill of the person by whom it was brought.

16.—The Siyuli, or Sephalika of the Bengalis, is a pretty small tree, called *Nyctanthe arbor-tristis* by Botanists from its flowers spreading at night and falling at sun-rise. The flowers that have dropped are gathered, and produce a beautiful though perishable purple dye; the bark and leaves are used in medicine, and the inner bark affords a red dye, when beaten with a little lime, or with $\frac{1}{2}$ of its own weight of that of No. 113.

17.—There is a species of *Gmelina*, of which no account published by modern Botanists has yet reached me; but Dr. Roxburgh in his manuscripts calls it *Gmelina Arborea*, and Rhede long ago described it under the name of *Cambula*. It is valuable on account of its wood, which although light is durable; is not readily attacked by insects, and is therefore peculiarly well fitted for making trunks, and is much employed by the natives in making their instruments of music. It is found in this district near Ghoraghat, but is rare, and is called Yoginichokro; while Gambhar, the name by which it is commonly known in the eastern parts of Bengal, is here applied to a very different tree, that will be hereafter mentioned, No. 92.

18.—A species of *Cordia* called Dhovoli, of which I have seen no account in Botanical books, is found in this district, where it grows to be a considerable tree.

19.—The *Ehretia laevis* of Willdenow, is a small tree found in this district. It was called to me Jonggoli Guroak or Guya, that is wild *Areka*, a plant to which it has in no part the most distant resemblance. I therefore suspect, that this name is not the real one.

20.—Another *Ehretia*, which I have found in many parts of India, but of which no Botanical writer has yet taken notice, was here called Bijol. It grows to be a very considerable timber tree, but is not very common. It was sent to Dr. Roxburgh, as a tree which in Nipal produces a good fruit; but, although the tree is very common in that country, some other must have been meant, as the fruit of this could not be eaten any where.

21.—One of the most common ornamental trees in this district is the Gulongcho, or *Flos convolutus* of Rumphius. It is often 20 or 30 feet high, and is very ornamental near the monuments of the Moslem saints.

22.—The *Nerium Antidysentericum* of Linnaeus, which ought to have been classed as an *Echites*, is very common in this district. It is not only a medicine, but its wood made into small beads, which the Hindus wear round their necks. At Peruya it was called to me the Dude, and a plant of that name is no doubt applied to make similar beads; but in other places, I know, that this *Nerium* is called Indroyov, while the Dude is considered as distinct. In fact, a very different plant was shown to me afterwards as the Dude, as will be hereafter mentioned, No. 93.

23.—The *Echites Scholaris* of Botanists is known to the natives of this district by the names Chhatin and Soptoporlo. It is very common, and sometimes grows to a great size; one which I measured at Potiram was 12 feet in circumference, at five feet from the ground. Its bark is used as a medicine for cattle. Its wood is considered as useless.

24.—The *Bassia obovata*, if different from the *Latifolia*, is found, but very rarely in the woods of Dinajpur, where it is called Muha, and is applied to no use.

25.—The *Mimusops Elengi*, L. called Bokul or Baul by the natives, is a common ornamental tree about villages. Its bark may be used as a tan, but the tree is of little value. The flowers are much valued by the natives, as they are convenient for forming chaplets. Their smell is too strong.

26.—In the woods of Peruya considerable quantities of a fruit called Khyrini are collected for sale. They are produced by the *Achras dissecta*, W. a very handsome tree nearly allied to the former.

27.—The *Diospyros cordifolia*, W. was shown to me in the woods, and called Sundor; but, as other people gave the same appellation to a quite different tree, there is no proper authority for this name. The other was of the order of rubiaceous plants.

28.—The Gab of the natives, and *Embryopteris glutenifera* of Botanists, is a beautiful tree common near the villages of Bengal: the fruit is eatable, but excessively sour. Its principal use is for paving the bottom of boats. It is beaten in a large mortar, and the juice expressed. This is boiled, mixed with powdered charcoal, and applied once a year to the outside of the planks. A good tree will give 4,000 fruit, worth two Rupees, and will be in full bearing in eight years from the time when it was planted. The number in Dinajpur is small, but sufficient for the demand. The wood is of little value. Gærtner, who first described this family of plants, has either made a great error in his description, and mistaken the upper for the under end of the fruit; or else later Botanists have been equally mistaken in considering the Gab as being a species of *Embryopteris*.

29.—The *Vangueria edulis* is one of the most common small trees about the villages of Dinajpur. It varies in sometimes having spines, and sometimes wanting them, and is called Moyna. Its fruit, which is about the size of an apple, possesses an intoxicating or rather deleterious quality, when fresh plucked; but after being kept a few days, may be eaten with-

out danger, and is said to be sweet and agreeable.

30.—The natives give the same name to a species of *Gardenia* or *Randia*, which shows the affinity of the two families of plants. In fact, these two species have a strong resemblance. So far as I know, no account of this species has yet been published.

31.—The Piralu of the natives is the *Gardenia uliginosa*, of Botanists. It is a middling-sized ugly tree, and its fruit is sometimes used in the curries of the poor.

32.—The two following species of *Morinda* seems also hitherto to have escaped the notice of Botanists. The one is called Daree Horidra, or yellow wood. It grows spontaneously in the woods, and its root is used as a dye.

33.—The other, from its containing about four berries united in its fruit, is called Charichoka. The bark of its root, beat up with a duck's egg and a little lime, is applied to the rude images made of potter's work, that are offered at the monuments of saints, or used by children as toys, and gives them a red colour.

34.—The Kadombo or Kodom, called by Botanists *Nauclea Orientalis*, is a very ornamental tree, and is common in Dinajpur. It is however inferior in size, and in the quality of its timber to the next species; but its beauty procures it a more common place near villages.

35.—The *Nauclea parvifolia* is called here Kelikodombo or Talikodombo, and like several other species of this family is a good timber tree, but is very little used.

36.—The *Cratæva Tapia*, called by the natives Vorna, is a common tree, especially in the Eastern parts of this district. It does not grow to a considerable size, and is of little use except as an ornament.

37.—The name Dengphol (at Ghoraghat) is applied to a tree which cannot well be reduced to any family of plants established by Botanists, but which comes nearest to the *Harangana* of Lamarek; and has a great affinity to the Mangosteen. It is a very ornamental tree, and its fruit is about the size of an apple, but too acid. It is now growing in the Company's Botanical Garden, and it is to be hoped, that Dr. Roxburgh's description of it will be soon published.

38.—The Jolpavi has usually been compared by Europeans to the Olive, on which account it has been called the *Elæocarpus*; but the affinity is very slight, consisting merely in the fruit being of the same shape and size. The opinions of Botanists concerning this tree are not very easily reconciled, which has probably arisen from the *Perinkara* of Rheede, and the *Ganitrus* of Rumphius, having been considered as the same. The tree of which I am now giving an account, and which is common in every part of Hindustan, is no doubt the *Perinkara* of Rheede, and is totally different from the *Ganitrus* of Rumphius and Gærtner. The fruit contains no oil but is acid, and gives a good flavour to curries, which is its principal use. In some parts it is preserved in oil and salt, and then no doubt acquires a greater resemblance to the Olive; but it is always a very inferior pickle. It is a very common tree in Dinajpur, both in gardens and woods.

39.—The tree called Kopittho, or Kotbel by the natives, has been classed by Botanists with the *Limonias*, and called *acidissima*, for what reason I do not know. Rumphius, who is remarkable among Botanists for having named plants with sagacity and good taste, calls it *Anisifolium*, the leaves having a strong and agreeable flavour of the Anise, and this name ought to be preserved. The fruit is eaten by the natives, but is very poor. In Dinajpur the wood is not applied to any use. Retzius has been blamed for classing this plant with the *Cratævas*, and it certainly has not the smallest affinity with the plants, which have been

properly so called, such as No. 35, but then its affinity to the *Cratæva Marmelos* of Linnæus is striking, and they cannot be separated in any system, that pretends to follow nature. The natives indeed have had more accurate notions than many Botanists, and call the plant of which I am now writing the Kot or wild Bel, while the *Cratæva Marmelos* is called simply Bel.

40.—This Bel is a very common tree, and thrives even in the hardest clays. The natives place a great value on the fruit, but it is miserably insipid. The tree is not so ornamental as the Kotbel.

41.—Another tree, very much allied to the last, is by the natives named Billeu and Sriphol, or the venerable fruit; for it is considered as an emblem of the spouse of Sib, and is a common offering to that God. The natives admire this fruit also; in fact, I have some doubt whether these two are not mere varieties of the same species. It is reckoned very sinful to cut this tree, except for the purpose of making a kind of carved stake, that is put in the ground on the consecration of a bull.

42.—The Nim, or *Melia Azadirachta*, is another sacred tree among the Hindus, and one of the most common in every part of their country. The tree has a considerable resemblance to the Ash, and its leaves are intensely bitter, and much used in medicine, especially as a fomentation, and in assisting holy men to resist the allurements of beauty. Images are made of its wood, which is considered as pure; as it is seldom eaten by insects, it might probably serve more useful purposes. In some parts of India a medicinal oil is extracted from its seed.

43.—Nearly allied to the former is a family of Bengal plants, of which no account has been given in the late Botanical systems. One of this family is a common tree in Dinajpur, especially near Ghoraghat, where it is called Pithras. In other parts an oil is extracted from the seeds of the two last mentioned trees: but its use is not known in this district.

44.—Allied to these also is the species of *Cedrella* called by the natives Tun or Jiya. It is pretty common near Ghoraghat, and is a valuable tree, both as affording flowers which give a dye, and as yielding a wood that makes tolerable furniture, and in Calcutta it is much used for that purpose. None is however exported from this district.

45.—The Konok Changpa, called by Botanists *Pterospermum suberifolium*, is chiefly remarkable for its beauty, and certainly is one of the most elegant flowering trees that can be seen. The flowers are offered to the gods.

46.—Nearly allied to the above is the Salmoli or Simul, called also Mondar, and when in flower it is one of the most gaudy ornaments of the forest or village, for it is every where common. It is the *Bombax heptaphyllum* of Botanists, at least the *Moulevavou* of Rheede, which is supposed to be of the same kind with an American plant described by Jacquin; but this seems highly improbable. There is no reason to suppose that this is not a native of Hindustan, and I believe that there are very few plants indeed that were originally natives of both Indies. Linnæus seemed to consider all regions within the tropics as India, and that they all produce nearly the same plants, and on this subject he has been the great source of error. In fact the cotton tree of the West Indies is much larger than our East India plant, and grows in a very different manner, with an immense tall stem, which sends out from its summit long horizontal arms. I have no doubt but that the trees are quite different, although having taken no notices concerning the West Indian kind, I cannot now point out the essential difference. I cannot account for Wildenow's stating that the stem has no prickles, as

in Rheede's figure that circumstance is most accurately expressed. Our Indian plant is a valuable tree. Its wood is that commonly employed by the natives for making doors, and window-shutters; for it lasts well in such situations, and is very strong to resist the attacks of robbers. The cotton is that commonly used for stuffing pillows. It is neither used for quilts nor mattresses, as it readily forms into lumps, and does not last. The fibre is much finer than that of common cotton, but is so straight that it cannot be spun.

47.—One of the most favourite flowers with the natives is the Changpa or Chompak, called by Botanists *Michelia*. The flowers are no doubt very odorous, but their smell is too strong and overpowering. The tree is common; but it is useful only as an ornament, and as affording flowers that are offered to the gods.

48.—The Chulita of the Bengalees is no doubt the *Syplia* of Rheede, which is said to be the *Dillenia speciosa* of Botanists; but the definition given of the *Dellipsaea* agrees better with our plant. Indeed this family is as yet but indifferently described. It is a superb tree although of little value; the fruit however is an agreeable acid in curries. The flowers are white and very showy.

49.—The *Anona squamosa*, called Ata by the natives, when cultivated with care is a tolerable fruit; but when it grows spontaneously about villages, it is exceedingly bad. It is called Custard Apple by the English; but whether it is the same with the West India plant of that name I cannot say. It is however probably an exotic in India, as I understand, that it has no name in the Songskrito language.

50.—The same is the case with the Lona or *Anona reticulata*, which in all situations is a most wretched fruit.

51.—The *Uvaria longifolia*, from its growing tall and straight, has been called Mast Tree by Europeans. The natives of Bengal call it Devdaru, a name that they also give to the Pine, and to several other trees which have not the smallest affinity to either. This is especially the case with the *Erythroxylon sideroxyloides* *E. M.* Devdaru is in fact a celebrated tree, and together with the Sara Asod and Bot, to be hereafter mentioned, is considered to be the usual residence of devils. The two latter are occupied by male devils (*Brohmoadityo* and *Bhut*), while female devils (*Sangkline* and *Petine*) occupy the two former. This kind of Devdaru being very ornamental, and fit for forming shady walks, has been spread since Europeans began to pay attention to the ornament of the country. In other respects it is a very useful tree.

52.—One of the most common small trees in this district is the Panyala of the country, Panyamal or Phalsa, which by Botanists is named *Flacourtia*. I must however say, that I am very doubtful concerning the species, and although I doubt much whether there is more than one kind in this country. I have been inclined to refer it sometimes to one and sometimes to another of the species that have been described. The fruit is like a small bullace plum, and very poor, but is eaten by children. I have not observed here the kind that is common at Calcutta.

53.—At Ghoraghat, the *Microcos paniculata* of Botanists was brought to me as a tree called Bunchuniya, and said to produce wood better fitted for making furniture than any other found at that place, although it grows to only a small size. The woodcutters they are being remarkably stupid, I cannot place much reliance on what they said.

54.—The Bixa, an American plant, is now rapidly spreading over Bengal, the inhabitants having found it a useful yellow dye, which they employ to give their clothes a temporary colour in the *Dolyatra* or

festival of Krishno. With this also colour the water, which on the same occasion they throw at each other with squirts. For these purposes it is well qualified, as the colour easily washes out, and the infusion has a pleasant smell. By them it is called Lotkan, and they say that before it grew commonly in the country, the dry fruit was brought from Patna. Probably some other fruit was then brought, and its use has been superseded by that of the Bixa, to which the natives have given the old name, as there can be no doubt of its being an American plant, and its fruit could scarcely have been brought here from the west of India. In many parts it is called European Turmerie.

55.—There is little doubt, that America has also furnished us with the Goyava, which now is spread all over the country, and propagates itself without care. In the vulgar language it is called Peyara; but it has no name in the sacred tongue. When cultivated with care, I have sometimes known this fruit tolerable; but in general it is very bad. With the authors of the Encyclopedie, I am inclined to believe, that the *Psidium pyrifera* and *pomiferum* form only once species and differ infinitely less than most kinds of the apple tree do.

56.—The Jombi or Jom is a very common tree both in woods and near villages. The Indians indeed are said to have given its name to their portion of the world, Jombudwip, or the Island of the Jumbu tree. It would be difficult to assign any good reason for this, as the tree is neither very large nor ornamental, and the fruit is execrable. By the natives however it is reckoned wholesome, and the timber is strong, although it does not polish. This I take to be *Calyptanthus Jambulana* of Willdenow, although most of what has been written by Botanists concerning the *Myrti Eugenia* and *Calyptanthus* of India would require revision. In fact, every thing concerning most of these plants is obscure and incomplete, and the subject is extremely difficult.

57.—From among these, Jussieu has with great propriety separated the *Eugenia acutangularis* of Linnæus, which is a common tree in this district, where it is called Ijhol or Hijol. It is very ornamental, and its wood is much used; but is neither strong nor handsome.

58.—The Nichon is a large tree, called by Botanists *Lagerstræmia parviflora*. Its timber is reckoned good; but it seldom grows near villages.

59.—The Babla or Gorsundor of Bengal has usually been referred to the *Mimosa farnesiana* of Linnæus, in which, I suspect, there is a mistake; and I am rather inclined to suppose, that it is the *Mimosa Indica* mentioned in the Encyclopedie Methodique, of which no proper account has yet been published, although it is one of the most common trees in India. It is rather rare in Dinajpur, and is seldom applied to use, although it is valuable for many purposes. The wood is hard and strong, fit for the plough and the naves of wheels; the bark is an excellent tan, and the tree yields a gum equal to the Arabic. The flowers are remarkably odorous.

60.—The Guye Babla is another very common species of *Mimosa*, not yet properly introduced into Botanical works; and it is to be regretted, that Dr. Roxburgh's accounts of these two trees should not yet have been published. In his manuscripts he calls this the *Mimosa Sepea*; for it makes excellent hedges, and serves equally well all the purposes to which the other is applied. Its flowers are not so odorous, and the bark, when recently cut, emits a most intolerable stench.

61.—The Khodir or Khoyer is the *Mimosa Catechu* of Botanists, and the tree from whence the valuable drug called *Terra Japonica* is prepared. The tree is common in the woods of Peruya, Jogodol, and

APPENDIX III—contd.

Ghoraghat; but it is only in the first that any of the drug is prepared. The number of people employed in this manufacture is small, and the following account was given by the agent of one of the landholders; for I could not find any of the manufacturers. According to the agent there are 25 furnaces, and each employs three men. Trees are selected, that are at least two feet in circumference, and these are old, for in this district the tree does not grow to a large size. The bark and white wood are removed, and then the heart is cut into small pieces, and beaten into a kind of stringy substance by means of the instrument called *dhenghi*. Equal quantities of this and of water are put into earthen pots, each holding from 10 to 20 seers, and are boiled for about six hours. Each fire contains two or three pots. The decoction is then decanted into a pot, and is formed into two kinds of Catechu. Khoyer and Papri Khoyer, the first dark and the second light coloured. The first is made by simply allowing the extract to dry in the pot without addition, the latter is made by putting some ashes of cow-dung in the bottom of the cooler. The ashes are covered with a fold of muslin, over which the warm extract is poured. It is sold to the merchants in these pots, and by them is formed into balls, and dried in the sun. The merchant makes about four seer of 100 sa. wt. from each pot, and pays a rupee for five pots, which should make about 51½ lb. avoirdupois. None can be made in the rainy season. Each furnace could make 50 pots in the month; but the workmen seldom exert themselves, and always are in debt to the merchant, who has great difficulty to induce them to work. Each furnace pays four annas a year to the landholder. The merchants sell the dried balls at seven rupees for the maund of the same weight, which is almost 103½ lb. avoird.

As I was not satisfied with this account, I sent a native into the woods, who gave me the following account: A manufacturer of whom there are five or six in Maldeh, hires four men, and remains with them in the woods for seven months in the year. He pays 12 rupees a year to the landholder for the wood, and cuts as much as he can manufacture. 40 seers of chips give five seers of catechu, and each month the manufacturer with the assistance of four labourers can make four maunds, or 160 seers of 100 sa. wt. or about 413 lb. avoirdupois, which he sells immediately to the druggists for 28 rupees. The whole produce of seven months is therefore Rs. 196 from this deduct 12 rupees for rent, 84 rupees for workmen's wages, at three rupees each a month on account of their living in the woods, and four rupees for the expense of sending the drug to market, and there will remain 96 rupees for the manufacturer, who does not require, at the utmost, a capital of more than 30 rupees.

It is very likely, that both methods of conducting this manufacture may be employed. The rent stated by the agent is perfectly absurd. The Maldeh khoyer or catechu is not reckoned of the best quality. The tree is rather scarce; and if it were wished to increase the manufacture, it would be necessary to destroy all the useless trees in some parts of the forest, and to allow none to grow, except this kind of *Mimosa*. It is one of the nine sacred plants of which small branches are burned to the planets, and the Hindus reckon nine of these bodies. This is sacred to the planet which presides over Tuesday (*Mongol*).

62.—The Chorki is a very common tree near Ghoraghat, and is a species of *Mimosa* that has not yet found its way into the modern systems of Botany: but did not escape the industry of Rumphius, who seems to have described it under the name of *Cortex Saponarius*. It is reckoned a useful timber.

63.—The *Mimosa Lebaeck*, as described in *Encyclopedie Methodique*, is a very common tree in most

parts of India, and grows near several villages in this district, especially in low places. It was called to me Jonggolijot; but I suspect, that it was not accurately named, and that its proper name is Korai, which is also given to the following; for the two resemble each other so much, that in common language they might readily be included under the same name. Its timber is strong.

64.—The *Mimosa marginata* E. M. is a tree that produces more valuable timber than the former, and is found in the woods of this district, where it is called Korai. Small boats are sometimes built of the Korai, which probably includes both kind.

65.—The Sangi or Somi, which Sir W. Jones makes a synonyme of the Babla, is alleged by my people to be different, and they show me the *Prosopis aculeata*. It is one of the nine sacred plants, and is offered to *Soni*, the planet which presides over Saturday. It is common in Dinajpur, but is applied to no use.

66.—The Tamarind tree, by the natives called Tetul and Tinteri, is a most valuable and elegant plant. Besides producing a fruit, that is too well known to require being described, and which is much used by the natives as an acid in seasoning their food, its timber is excellent for many purposes, and makes handsome furniture. As it is hard and strong, it is commonly employed for making oil and sugar mills, and washermen's boards. The seeds are frequently employed by the Indian dyers, and by those who weave woollen cloths. A good tree will give about 350 lb. of fruit, worth from three to four rupees. The average value however may be two rupees a year, and is nearly of the same amount with that of a good mango tree. The wild tamarinds of Peruya are the only fruit exported from this district, except a few mangoes from the same vicinity.

67.—The *Cassia Fistula*, called Songdhalu and Sonalu by the natives, is one of the greatest ornaments of India. The leaves bruised and mixed with lime-juice are used as a cure for the ring-worm, and are applied to reduce tumours in cattle. The natives here seem to be ignorant of the purgative quality of its fruit. It sometimes grows to a very considerable size.

68.—The *Moringa* of Botanists is one of the most common trees about the villages of this district, where it is called Sogena and Sobhangion. The flowers, unripe fruit, and leaves, are common ingredients in the dishes of the natives. The bark of the root is used by Europeans as a succedaneum for horse-radish, to which however it is very inferior, the seeds, which are said to be the Behen nuts of the old shops, are applied to no use by the natives, who do not know that they contain oil.

69.—The *Adenanthera Pavonina*, called Rocktochondon by the natives, is found about the village of Dinajpur. The native name signifies Red Sandal Wood, and its wood is said to be odorous, and it may be used instead of Sandal in the worship of all the gods except Vishnu. It is probable, that the trees which grow near villages may have no scent, for that is often the case with the real Sandal. There seems however to be several different trees in India that are called Red Sandal, and my inquiries have not yet been sufficiently extended to enable me to treat the subject fully.

70-71.—The *Sal Kanchon*, a *Bauhinia* of which no mention is made in Botanical systems, and Swet Kanchon, or *Bauhinia candida*, are very common trees near the villages of Dinajpur. They are small trees for little use except ornament but they produce most elegant flowers. The young pods are used as a vegetable in curries.

72-73.—The Vokpushpo of the Songakrito is by the vulgar divided into two kinds, called from the colour of the flowers Lalvok and Sadavok; and in this they

APPENDIX III—contd.

have been imitated by modern Botanists, contrary to all their professions of not regarding colour. Ever since the latter times of Linnæus they have been also unfortunate in the different families of plants into which they have thrust these elegant trees. Linnæus, in his first attempt to class these plants with the *Robinias*, seem to have approached much nearer perfection than afterwards, when he classed them with the *Aischynomene*. Willdenow, who names them *Coronilla grandiflora* and *coccinea*, has been equally unfortunate. The tree is very common about villages, and its flowers are used as offerings to the gods. The calyx and pistillum are fried and eaten with rice. The unripe pods are also used as a vegetable in curries. The wood is of no use except for fuel.

74.—The elegant tree, called *Erythrina Indica* in the *Encyclopædie Methodique*, is called by the natives *Pahitamadur*. In this district, although it possesses several advantages, the tree is not very common. Any cutting, however large, immediately takes root, so that it is an excellent material for hedges, especially as it is prickly. Its wood is both light and strong, so that the carpenters of Calcutta prefer it to all others for the poles of palanquins. Its leaves are used in medicine, and its flowers are very ornamental. It does not however grow to a large size.

75.—A much more common, and equally beautiful tree, and much resembling the former, is the *Polas*, or *Butea frondosa*. The flowers of this are not only offered to the gods, but in the festivals of spring serve to give a temporary yellow dye to the clothes of their votaries; on which account it is called *Vosonti*. The tree is of little use; and cannot be propagated by cuttings; but it is very common in most forests. It is sacred to the planet of Monday.

76.—The *Dalbergia arborea*, W. is one of the most generally diffused trees in India; but is not very common in this district, where it is called *Dorkorongjo* or *Dorkoromcha*, and is applied to little or no use.

77.—The plant consecrated to the memory of Sir William Jones, and called *Osok*, is not uncommon in this district. It is of no use except to afford elegant flowers that are offered to the Hindu gods.

78.—The original *Oncardium* of the shops, a name properly restored by Jussieu to the *Semecarpus* of Linnæus, is the *Bhela* of the natives. The juice of its nut leaves an indelible stain on linen, and is used for marking it. The nuts are also used by tanners, especially in dressing the hide of the rhinoceros or buffalo to form targets. The timber is of little value. It is common in the woods.

79.—The Mango (*Amro* or *Am* of the natives) is one of the most common trees, not only in the plantations of this country, but in the woods, where it has grown spontaneously from the seeds of those that have been planted about villages, which have been deserted. The mangoes called *Maldeh* have a high reputation, and may be considered as one of the finest fruits in the world: but few of these grow at *Maldeh*; all the plantations of the most valuable kinds are on the opposite side of the *Mohanonda*, in the *Puroniya* district. Still however the mangoes of the left bank of the *Mohanonda* are preferable to any others in *Dinajpur*.

As the produce of the mango tree, even in its present state, is one of the most valuable in this district; for it cannot be of less annual value, on an average, than 450,000 Rupees, and as the management is better understood at *Maldeh* than any where else, I shall give some account of the manner in which this fine tree is cultivated by the people of that place. A bigah of ground, which there is rather more than $\frac{1}{2}$ of an acre (3,644) is considered as a direct plantation. I shall now detail what the cultivators state as their expense and profit on such an orchard.

First Year's Expenses.

	Rs.	As.	P.	Rs.	As.	P.
To making a mud wall round the whole, ..	2	0	0			
To ploughing 10 or 12 times from the middle of September until the middle of November ..	1	0	0			
To 25 seedlings, three years old, raised with much earth ..	2	0	0			
To planting in deep pits ..	2	0	0			
To watering and weeding, one man for eight months, ..	18	0	0			
Total, ..				29	4	0
<i>Expense of each of the 2, 3, 4, and 5 years.</i>						
To ten or twelve ploughings, ..	1	0	0			
To repairing the wall, ..	1	8	0			
Total, ..				2	8	0
Expense of the first year, ..	29	4	0			
Expense of the 4 following years, ..	10	0	0			
Rent for 5 years, at 14 Ans. ..	4	6	0			
Stock required, Rupees, ..				43	10	0

In the 6th year, or when the trees are from 8 to 9 years old, they begin to yield saleable fruit, partly green, partly ripe; and their produce is reckoned to be doubled every year for 5 years, in the following manner:

6th year each tree	160 M. total	4,000, at 960 per R.	Rs.	4	2	8
7th " " "	320 " "	8,000, " " " "	Rs.	8	5	4
8th " " "	640 " "	16,000, " " " "	"	16	10	8
9th " " "	1,280 " "	32,000, " " " "	"	32	5	4
10th " " "	2,560 " "	64,000, " " " "	"	56	10	8

The produce now becomes nearly stationary, for although the trees grow longer, and produce a greater number, the size and value of the fruit diminishes. The only expense after the five years is to watch and collect the fruit, the rent, and a little ploughing or hoeing. The wall is allowed to go to ruin. In other places of this district the produce is of less value, and may be estimated at two rupees each tree, for a very large proportion of the mangoes, when allowed to become ripe on the tree; contain an insect (*Curculio*), that renders them useless. They are therefore in general gathered when unripe. A plantation will last fifty or sixty years.

It might be supposed, that with such a large profit, the plantations would be extending fast, but this does not appear to be the case. Most even of the old plantations are neglected, and do not contain one-half of the trees which they might. Useless trees, especially wild figs, spring up, carelessness allows them to take root, and the prejudices of the land-holders prevent them from being cut. Besides, there is no encouragement for plantations. If a tenant gives up his lease, he is allowed nothing for the trees that he leaves behind, although he may have been at the whole expense of rearing them. The great uncertainty of the crop is no doubt also a strong objection to these plantations. In many years the mango almost entirely fails, and in others it is so exceedingly abundant, that there is scarcely any sale for the produce. Heavy fogs or rains, when the flower has expanded, almost certainly prevent the fruit from forming. Besides a capital of 40 or 50 rupees is rather uncommon.

The natives are entirely ignorant of the art of engrafting, which is the only means, by which good

APPENDIX III—contd.

kinds can with certainly be reared; for the seed taken one tree will produce 20 different kinds, not one of which perhaps may resemble the parent. The precautions, which the natives take, are no doubt entirely useless.

They will not plant a mango seed, the fruit of which has been bitten by the teeth, or cut with iron. The people of India usually attribute the abundance of the insect to the soil or to climate; but I am rather inclined to think, that the quality of the fruit has much more effect, because I observe some trees that always escape in the worst districts, and observe that the insect is peculiarly fond of the sour resinous kind. I confess, however, that this opinion is still liable to great uncertainty: but if well founded, it is a strong additional reason for the employment of engrafting.

In most parts of this district the fruit is chiefly used green or unripe; for when allowed to ripen, as I have said, it becomes full of insects. Those near Maldeh are not so subject to this loss. In Dinajpur green mangoes come into season about the 12th of April, and continue until almost the end of May. During that season they enter largely into the dishes of the natives, and are preserved at Maldeh in sugar or honey. In other parts many are preserved in mustard seed oil. Some are cut into four parts and dried in the sun; but by far the greatest part is preserved by cutting the green pulp from the stone, and beating it with mustard seed (*sorisha*), salt, and turmeric, to which are occasionally added some of the carminative seeds, such as *commin*. Those preparations keep throughout the year, and are a common seasoning for the food of the natives. The ripe mangoes continue common from the end of May until the middle of July. Their expressed juice is frequently inspissated by exposure to the sun: in this state it will keep throughout the year, and is eaten with milk.

The wood of the mango tree is much used, owing to its being plenty; for its quality is very inferior to that of many trees, which are little employed. Small boats built of it do not last above two years. Most of the package boxes are made of this wood. The inner bark contains a great quantity of a yellow colouring matter; but as yet no method has been devised for fixing it as a dye.

80. Nearly allied to the mango is a family of plants, which Sprengle, a learned German, has done me the honor of calling by my name. A species of this was shown in the woods of this district as the *La* or *Lodh*, which is used both by dyers and tanners; the former use the bark, the latter the leaves. I am far however from being certain that the person who showed it was sufficiently skilled.

81. The *Jiyol* of the natives is one of the most common trees in India, and is chiefly valuable for its being easily propagated by cuttings, no matter however large, so that a hedge or avenue may be formed very quickly, as has been done near Madras. In the dry season, the tree loses its leaves, and is never handsome. Its wood is of very little use, nor does it form a good fence, as it has no thorns. In this district, however, it is the hedge most commonly used. It produces a great quantity of gum; but the qualities of this have not yet been ascertained. In this district, many houses have been built with large branches of this tree, that have been placed in the ground for posts and these have taken root, have pushed forth branches, and now produce a very picturesque appearance. I do not find this tree described in modern systems; but in its Botanical affinities it comes very near to the *Rhus vernix*, W. although there are such differences that Dr. Roxburgh seems inclined to form it into a separate genus.

82. The *Spondias Amara*, F. M. is a much more elegant tree, of the resiniferous order. The French Botanists are justly to be praised for having preserved its native name, which is far from being barbarous. In this district it is called *Amra* or *Amratok*. The fruit, both green and ripe, is an excellent seasoning in cookery, which is the only thing of use that the tree affords.

83. The *Jujuba* of Botanists is by the natives called *Koh*, *Kul*, *Boyer*, and *Bodori*, usually pronounced *Bodol*, and is so common, that it communicates its name to several places, especially in the S.W. of the district. It is there however much more remarkable for quantity than quality; for I saw none, that could be reckoned good, and in some parts it is a tolerable fruit; the natives pick out the stones, and dry the ripe pulp mixed with salt and tamarinds, which forms a seasoning for their rice. It is a small tree, and its timber is of little use.

84.—A larger species of the same genus, the *Zizyphus xylocarpus*, is common in the woods, and its timber is reckoned of some use. Some people called it the *Jonggli* *Boer*, or wild *Jujba*; while others call it *Pitalu*, but this was also applied to a very different tree (No. 92), so that I cannot adopt it with certainty.

85. The *Kamranga* is a small tree very common near villages, and in the woods of this district, and is the *Acerrhoa Carambola* of Botanists. The fruit, which is very acid is often made into tarts by Europeans, who sometimes imagine, that it has a resemblance to the gooseberry. It is also used by the natives as an acid seasoning, but is not much valued.

86. Nearly allied to the above, and once joined with it in the same family by Linnaeus, is the *Horiphol*, called also *Loboni* and *Loyair*. It is now called *Cicca* by Botanists, and probably both *disticha* and *nudiflora* may be referred to the same plant; at least I am unable to determine to which of the descriptions the plant of this district has the greatest resemblance. It is a handsome, although small tree, and grows pretty frequent near villages. The fruit is the only part used, and in its qualities very nearly resembles that of the last mentioned tree.

87. Still nearly allied to these is the *Emblica* of Botanists, who seem to have borrowed the native name *Amlaki*. It has been placed in one of those convenient tribes (*Phyllanthus*), into which European Botanists squeeze any thing with the structure of which they are little acquainted, and from which they have carefully excluded the only plants, *Xylophylla*, that deserved the name. The fruit preserved in either sugar or honey is much used by the natives as a sweetmeat, and dried as a medicine. The natives have an idea, that this fruit, and that of the *Chebula Myrobalans*, have never been found ripe, except by some very holy persons; and it is supposed, that such as have been favoured with eating such a rarity, have been ever afterwards exempted from hunger. The wood is little used.

88. A fruit called *Lotko* is mentioned in the *Akbery* as peculiar to this district; but it is found in all the eastern parts of Bengal, and is common in the kingdom of *Ava*. It has strong affinities to the three last-mentioned plants, and the pulp, that surrounds its seeds, is rather agreeable, and might perhaps be improved by cultivation. It has not yet found its way into the systems of Botany.

89. The plant which I described in the account of the embassy to *Ava* by Colonel Symes, under the name of *Agyneia coccinea*, must be removed to a newly-formed tribe called *Baradleya*. It was shown to me in the woods of this district by the name of *Boro Amla*, and is a small tree of no value.

APPENDIX III—contd.

90. The *Clusia stipularis*, L. was shown to me by the name of Bonkangthali, but I am uncertain concerning the accuracy of the information, as a very different tree (92) was called by the same name. The tree grows to a pretty considerable size, and has been very improperly classed with some African shrubs. Its fruit is a berry that contains much oil in its pulp, which is rather an uncommon circumstance. I have already seen seven or eight Indian plants of the same family; its bark is used as a yellow dye.

91. Among the other plants of this family is that called Kukurbichha, of which I have seen no account in the writings of Botanists. It is common near villages, and grows to be a small tree with very ornamental foliage.

92. One of the most common trees in the Dinajpur district, both near villages and in woods, was called by so many different names, most of them applied also to other plants, that I am quite uncertain concerning its real appellation. It was called Bonkathali (a name given to No. 90) Bharul, Pitah, and Pitahu, (a name given to No. 84) but its most common appellation is Gambhar. Now this name, I know, is given to No. 17 both in Chittagong and at Goalpara, where the wood is much esteemed, and the leaves of the two trees have such a strong resemblance, that inaccurate persons may be readily mistaken. The confusion renders me doubtful, whether or not the wood of this tree is really as useful as that of No. 17, which is undoubtedly the proper Gambhar. I find no account of this tree in the writings of modern Botanists; but it is either the *Canschi* of Rheede, or approaches near to that plant. I am in a great measure induced to believe this from that valuable author's having placed it next to the Cumbulu, which is the tree No. 17, to which our plant has the strongest resemblance. According to the present plant, it might be thrust among the *Crotons*, a collection of plants, which seems to have been made from any specimens of exotics, that could not be otherwise arranged.

93. To this convenient family may also belong a tree that was shown to me as the Dude, from the wood of which are made beads that are much worn by Hindus; but in this there is some doubt (see No. 22). The tree has not yet found its way into modern systems of Botany.

94. The Sindur derives its Botanical name from the worthy Dr. Rottler of Madras, and its Bengalee name from the powder which covers its fruit and resembles red lead. The use of this as a dye is not known to the natives of this district. The tree is very common, but does not grow to a large size.

95. The *Ficus Indica* was celebrated among ancient writers, and under the name of Banyan tree came to be equally renowned among the modern English. Indeed no person who has visited India could avoid being struck with admiration at its great size, the picturesque appearance of its trunk, the fineness of its foliage, intermixed with thousands of golden colofred berries, and above all by its singular manner of sending down roots from its branches, and of forming new stems. Every thing concerning the history of this tree is clear, except among Botanists, and the editor of the Hortus Malabicus seems to have led the way of error (Partis III. pagina 74, in nota), in which he has been followed even by Linnaeus. So far as can be judged, this great Botanist received specimens from the West Indies of a tree which resembled the Indian Fig in its remarkable manner of growth; and as he seems to have considered that the two Indies had nearly the same vegetable productions, he immediately concluded, that his specimens belonged to the Indian Fig, and described them as such. He also had probably received specimens of the true Indian Fig from Bengal, with-

out any account of its manner of growth, and described this under the name of *Ficus Bengaleensis*, and I have already made an excuse for the appellation: but I believe on the whole, that the safest plan for Botanists to adopt on the occasion, would be to expunge whatever has been said concerning the *Ficus Bengaleensis* and *Indica*, since the time of Rheede. The authors of the Encyclopedie, indeed, seem to have been aware of the Linnaean error, but even they are wrong in considering this tree as the Pipol, and the description which they give of the *Ficus Indica* is too nearly applicable to the *Ficus Bengaleensis* or Bot. The leaves of this tree have no dots on their upper surface, which is said to be the case with the *F. Indica*: but I suspect that the leaves of the *F. racemosa* has been taken for those of the Indian Fig, by the Botanists, who have given it that character.

This tree probably from its beauty, for it is of little use, is in great esteem with the natives of Bengal, and is considered by them as the female of the Pipol. As they are supposed to represent a Brahmin and his wife, it is reckoned a sin to cut or destroy either, but especially the male; and it is considered as very meritorious to plant a young male tree close to a female, with some religious ceremonies approaching to those of marriage, but not so intolerably prolix nor expensive. In this union the natives have discovered great taste, the elegant lightness and bright foliage of the Pipol being well fitted to contrast with the rigid grandeur of the India Fig, although from these qualities it is difficult to account for their having appropriated the sexes of these trees in the manner that has been done. The branches and leaves of these two trees being a favourite food of elephants, the keepers, who are low people, make sad havoc on the emblematical Brahmins; but this is submitted to with patience, provided they do not attempt the entire destruction of the plant. It is usual to place a piece of silver money under the Banyan tree, when it is planted, for it is supposed, that otherwise, it neither will grow to a large size, nor send down fine roots. In Bengal this tree is called *Nyagrodh* and Bot. Besides its being an ornament, an affording a wholesome and cool shade, and being a good fodder for the elephant, this noble tree contains a milky juice which conglutates into a kind of elastic gum, and makes admirable bird-lime. The milky juice is collected by making incisions in the branches, it is strained and mixed with $\frac{1}{3}$ of its weight of mustard-seed oil. It is then fit for use. The juice of the tree next to be mentioned possesses exactly the same qualities; their wood is of little value. In this district, the young roots, which this tree sends forth from its branches, are often used for ropes. Notwithstanding some good qualities of these trees, the prejudice in their favour is attended with many bad effects. Their fruit being a favourite food of monkeys and birds, their seeds are constantly deposited on buildings, and on other more useful trees; and wherever they find a crevice, they take root. They send long filaments to the ground, and no sooner procure nourishment from thence, than they crush and overpower their original supporter, and thus lay waste all old buildings and plantations. This is not peculiar to these Figs; most other Indian trees of this family possess the same noxious faculty, but these may be eradicated, whereas the two holy trees can only be removed, when it can be done without danger to their lives, that is, when they may be transplanted, which is seldom the case.

96. The *Ficus Religiosa* of the Botanists is the Oswottho, Asod, or Pipol of the Bengalees. Although it wants the majestic size and numerous stems of the Banyan, it possesses great elegance. The various roots that it has sent down from a tree or building on which it first germinated, often form a trunk of

the most picturesque form, while the beautiful shape of its leaves, and their tremulous motion like those of the aspen, give it a peculiar elegance. Its equalities have been detailed in the account of the Banyan tree. It is sacred to the planet of Thursday (*Vrihaspati*, Jupiter).

97. There are several trees, that have a great resemblance to the last mentioned Fig, and although they want some of its elegance, are still very fine, and nearly of the same use. They are reckoned, however, rather heating food for the elephant, although from this theory, their unfitness for the animal may be doubted. They are not considered holy, and a great many names are applied to them very indiscriminately, such as porkoti or Pakur, Naksa, and Nakor. I think that in this district I have observed three very distinct species: the first I shall call Pakur. In the Encyclopædie it is considered as a variety only of the *Ficus Religiosa*; but for this I see no sort of reason.

98. The next Fig tree of this district I shall call Nakor. It may perhaps be the *Ficus pyrifolia* of the Encyclopædie; but this is doubtful. It is readily known by its berries, which are about the size of a pea, and are covered by long white hair.

99. The next Fig, which I shall call Naksa, differs from the former in having smooth berries. I cannot refer it to any species in the modern systems of Botany; but it is the *Tojola* of the Hortus Malabaricus (P. III. tab. 63); from whence it would appear, that the Brahmins of the south give the same name to this tree, that those of the north give to the *Ficus Religiosa*; the leaves of these two last are much smaller and narrower than those of No. 97.

100. Among the Indian Figs that are esculent for man, there are two kinds in this district; they cannot be called fruit in the common acceptation of the word, as they are only used as vegetables in cookery: the first is one of the most common plants in India. Dr. Roxburgh, in his Plants of Coromandel, No. 124, calls it *oppositifolia*, which at once distinguishes it from every plant to which it has any considerable affinity. I should have supposed, that this was the *F. sympathyfolia* of the Encyclopædie, had not the learned and accurate authors omitted this circumstance. It is not improbable, however, that they may have seen only imperfect specimens; for the plants of this kind are very difficult to preserve. In this district it is called Dumor, Dumbor, and Khoska, and its fruit is very much used.

101. The *Ficus glomerata* of Dr. Roxburgh, (Coromandel Plants, No. 123) is the Jogdumor, or Jogdumor, Yojingyo or Jogingyo Dumbor of the natives. Dr. Rottler, in a conversation which we lately had at Madras concerning the *Ficus Indica* of Linnæus, seemed inclined to think, that this may have been the plant which that celebrated Botanist meant; and it certainly comes nearer his definition than any common Indian Fig that we know: but I have no doubt that Linnæus had in view an American plant, which sends roots from the branches, and this is not the case with the Jogdumor. This tree is no doubt the *Ficus racemosa* of the Encyclopædie nor do I know the reason, that has induced Dr. Roxburgh to consider it as different from the *Ficus racemosa* of Linnæus, unless it has been discovered, that the plant described by the celebrated Swede differs from the *Atty Alu* of Rheede, which no doubt is our plant. It is a very common tree near villages, and its trunk and larger branches produce bunches of large Figs, which make very good curry. In Songskrito it is called Orumbor, and it is sacred to the planet of Friday (*Shukra*, Venus).

102. Nearly related to the Figs, are the Bread Fruits, of which the Jack is the finest that we have in India. It is very common in this district wherever

the soil is free, but does not thrive in a stiff clay. This tree, called *Artocarpus integrifolia* by Botanists, is the Ponos, Kontokiphol, and Kangtal of the higher and lower dialects of Bengal. It has a beautiful foliage, exhales a delightful odour in February, when in flower; produces a very useful fruit; is an excellent fodder for elephants, and produces a timber that is both useful and ornamental for the cabinet-maker. Unfortunately it wraps much with heat, and therefore is not well fitted for this country; but would be useful where the climate is less severe. The wood is also used as a dye. The fruit has a nauseous smell, and its flavour is not agreeable to the generality of Europeans; but the natives are fond of the pulpy envelope, by which the seeds are surrounded, although they do not think it wholesome. The green fruit is much used as a vegetable in curries, and the ripe seeds are preserved for the same purpose. In some parts of India, indeed, they form the common food of the people for two or three months in the year, just as chestnuts do in the south of Europe; and in fact, when roasted, they have a strong resemblance to that fruit. In Dmappur, the Jack is rather neglected, and its produce does not sell so high as that of the Mango.

103. The species of *Artocarpus* called in this district Dohu, Duyo, and Borol, does not seem to be described by the systematic writers on Botany, and is the least useful plant of its family. The fruit is small and sour, and is very seldom used, except by the poor. The wood is of little or no value. The inner bark, when beaten with that of the tree No. 16, gives a red dye that is used by some artists of this district, and is employed by tanners to give their skins a dirty orange colour.

104. The Sakot or Sara is one of the most common trees in this district, and indeed in most parts of India. By Dr. Koenig it was considered as a species of *Trophis*; but has strong Botanical affinities with the Mulberry, and is no doubt the *Tinda Parua* of the Hortus Malabaricus, which Linnæus has called the *Morus Indica*; but most of what has been written concerning the *Morus Indica*, relates to a totally different plant, on which the silk-worm is fed. It is of very little use. The natives use a small branch of it in place of tooth-brush, and suppose that it not only cleans but strengthens the teeth.

105. The Pangpiya of Bengal has had its name preserved in the *Papaya* of Botanists. In every part of India it is a common tree near villages, but is of very little use. The natives like the ripe fruit, and reckon it wholesome.

106. The *eltis orientalis* of Botanists is a very common tree in this district, where it is called Jig. It has an ornamental foliage, but I know of no use to which it is applied.

107. The Khagorbhela is one of the most common trees in this district, but as I never saw its fructification, I know not its Botanical history. By boiling its bark yields a gum or gluten, that is used by those who make artificial flowers.

108. Jibon.

109. Goneyari.

110. Parul.

111. Keng.

112. Chamkul.

113. Jamrul.

114. Borophedus.

APPENDIX III—contd.

I had no opportunity of seeing these trees, and have nothing to say concerning them; but that they are found growing in the woods, or near the villages of this district.

In the general Statistical Table (No. 1), I have mentioned, that in this district there are perhaps about 260 square miles which are overflowed in the rainy seasons; and great part of this extent is covered with long reeds, commonly called grass jungle by the English. Some part is no doubt bare sandy land, but as a small part of the land that is not inundated is overgrown with long reeds or harsh coarse grass, we may estimate the extent of this division of the wastes at 260 miles. Although several of these reeds are applied to use, this land in its present state, may be considered to be of as little value as that which is overgrown with woods, and it is equally pernicious by harbouring destructive animals. If the whole were equally diffused through the district, use might be perhaps procured for a considerable part of its produce: but it is generally disposed in such large masses that the neighbouring cultivated country cannot consume a hundredth part, and the produce is too bulky in proportion to its value, to admit of being carried to a distance.

The natives, whom I consulted, seemed to have only confused notions concerning the different kinds of reeds that are contained in these wastes, and sometimes they brought the same species under different names, while at other times two or three species were called by the same appellation. What I have to say on this subject, therefore, gives me very little satisfaction; and I may further state, that in this district less use than common is made of these plants, and their place is supplied by the bambu, which indeed might probably serve every where much better, were it not somewhat more troublesome to work.

1. The Kus or *Poa cynosuroides* is a sacred plant among the Hindus, and is dedicated to the invisible planet Ketu, which occasions the eclipses of the sun. It is very common in the wastes of this district and mats made of it are exported to Calcutta, where there are used in religious ceremonies.

2. The Kese is another harsh grass, the leaves of which are used to form a coarse kind of rope. When exposed to the weather, in tying fences and hurdles, these ropes last about a year. The plant brought to me as the Kese was the *Saccharum Spontaneum*; but I suspect that a wrong plant was brought. It is also used as fuel.

3. The Ulukhoris, one of the reeds most used by the natives of this district. I have not seen in flower, and therefore cannot say what its botanical name may be; but the plant called by this name at Goalpara is the *Saccharum cylindricum*. Its leaves form an excellent thatch, and its stems are very frequently used in making the hurdles, which serve the natives for walls, both to their houses and to surround the yard. These hurdles (*tati*) are usually made of reeds laid parallel to each other, and confined between sticks or split bambus, which are tied together, and cross each other, at right angles. In the better sort of hurdles the reeds or bambus are first split and wrought into mats, and these are formed into walls in the same manner. In this district no mats of this kind are made from reeds, unless we include the bambu under that denomination. The Ulukhor is often used as fuel, and its stems, which are spongy, are employed to float nets. In some parts fields of it are preserved for thatch, and yield a good rent. These two last reeds are eaten by the buffalo; but they are extremely coarse.

4. The Nol or *Arundo Bengalensis* is a very large reed, not common in this district.

5. The Khagra is a reed with which the natives usually write; from its various sizes, I should judge, that there are several different kinds; but I have not seen the flower. In this district it is not common and does not grow to a large size.

6. The Sor, from its white flowers which I have seen at a distance, must be either an *Arundo* or *Saccharum*. It is little used.

7. The Sorongio is the *Saccharum spontaneum*; a fine large reed, pretty common, but little used.

8. The Ikir is one of the most common reeds of this district; but is chiefly used for fuel, by fishermen in making their traps, and by the cultivators of betel-leaf for sheltering the tender plant which they rear.

9. The Byana seems to be the *Andropogon schænanthus* of the Encyclopedic; at least, the description applies tolerably well to our reed, which is very common but is applied to little use.

10. The Gongdhayi is an *Andropogon*, of which no account is to be found in the botanical systems. At Calcutta its root is used for making hurdles, which are placed at the doors and windows of chambers in the hot season, and are watered to produce coolness. The natives here know nothing of this art, but the stems are much used for making hurdles. In the parts of this district, where much sugar is boiled, fields of it are kept for fuel, although wood might be had in abundance, but wood is troublesome to cut. This plant seems to vary much from the soil in which it grows: when it is produced in a dry place, it is largest, and its root is odorous; the stem is then called Birna, and the root is called *Khos Khos*, but its leaves are very harsh. In moist places, the elephant-keepers call it Kotra, and the young shoots are a useful fodder for this noble animal.

11. The Sokorkondo is a most elegant *Andropogon*, of which no description has been published in the Encyclopedic.

12. Nagormutha is a species of *Scirpus*, with a triangular stem, of which the mats that the natives sleep on are usually made. I have not seen the flower.

These are the vegetable productions, which nature, with little or no assistance, has chiefly provided this district; but numerous bushes and herbs are scattered in the fields, ponds, marshes, and other waste places and many of them are applied to use. Of these I shall now take notice.

The poorer class of inhabitants, as I have before mentioned, are unable to procure from gardens the vegetable seasoning that would be requisite for their insipid diet; they have therefore recourse to the fields, to ponds and thickets, from whence they obtain a scanty and coarse supply.

1. Plants of the kind called *Torkari*, which are insipid succulent fruits or roots that are fried with oil in curries, or are boiled with salt and capsicum.

1. Dumbor; *Ficus*—see trees No. 100.

2. Yogingyo or Jogingyo Dumbor—see trees No. 101.

3. Piralu—see trees No. 31.

4. Jonggoli Alu, Wild *Dioscoreas*, probably of several sorts.

5. Bangser Kongra, young shoots of the bambus.

6. Ram Baigon or Begun, *Solanum stramnisolium*, E.M.

APPENDIX III—contd.

II. Ombolitos, or acids.

1. Jolpaye, *Eleocarpus serrata*—see trees No. 38.
2. Tetul, *Tamarindus Indica*—see trees No. 66.
3. Chalita, *Dillenia speciosa*—see trees No. 48.
4. Amra, *Spondias Amara*, F.M.—see trees No. 82.
5. Noyari, a tree nearly related to the *Hansium* of Rumphius.
6. Deuyo, *Artocarpus*—See trees No. 103.
7. Kamranga, *Averrhoa Carambola*—See trees No. 85.
8. Boruyi or Kul, *Zizyphus Jujuba*—see trees No. 83.
9. Koromcha, *Carissa spinarum*.

III. Sak, or leaves, flowers, and stems, that may be fried or boiled to give a taste to rice.

1. Sojina, flowers of the *Hyperanthera Moringa*—See trees No. 68.
2. { Kangta Notiya, } *Amaranthus spinosus*.
 { Kangta Khoriya, }
3. Notiya, *Amaranthus oleraceus*.
4. Kochu, the petiole of some wild Arums.
5. Helongcha, *Polymnia*, a species not published, *Jussieu repens*.
6. Jonaki, *Jussieu repens*.
7. Kalanunya, *Convolvulus repens*, and *repens*, which are of the same species.
8. Susoni, *Marsilia quadrifolia*.
9. Hela nali; the root is called here Baromutha, but its proper name is said to be Saluk. It is eaten raw by children. The stem, which supports the flower, is dressed in curries as a Sak. The fruit in this district is called Bhengvit, but its proper name is said to be Sovla. When unripe, it is dressed as a Torkari; when ripe, the seed is parched and eaten. The plant I believe is the *Nymphaea Lotus*.
10. Dima, { *Pharnaceum Mollugo*.
 Gima, }
11. Putika, { *Basella cordifolia*.
 Soda Pungyi, }
12. Lal Pungyi, *Basella rubra*.
13. Sanchya.
14. Dulobi, { *Pholmis Indica*, W.
 Dron, }
15. Goyaliya, *Cissus quadrangularis*.
16. Dengke Sak, an *Asplenium*, of which I see no notice in books.
17. Siyal Bathuya, *Chenopodium Album*.
18. Kalo Teporiya, *Solanum nigrum*.
19. Nune,
20. Amrul, *Oxalis corniculata vel pusilla*.

IV. Vegetables used without being cooked.

1. Ata, *Anona squamosa*—see trees No. 49.
2. Lona, *Anona muricata*—see trees No. 50.
3. Kalo Jam, *Calyptranthes Jambulana*—trees No. 56.
4. Singgur, { *Trappa*, fruit.
 Paniphol, }
5. Kesur, *Cyperus tuberosus*, roots.

6. Podmo bij, *Nelumbium* seeds. The flower-stem is also eaten raw. In China the plant is cultivated on account of these stems, which are a vegetable very commonly used in that country.

It was my earnest wish to have ascertained the official plants, those used by the natives in medicine; but after much pains I have been able to obtain no information concerning the subject, on which reliance could be placed. Being unable to procure a physician to give me information, at Dimajpur, I sent an intelligent man to the shop of a druggist, to make out a list of such plants as he sold, for I found that this class of men have no books containing a list of officials. The man, after several days' labour, brought a list sufficiently long; but on examination it was found to want many of the most material articles. A collection of samples, usually employed by the druggist, was procured to bring the plants, but after some days' trial I found, that no trust could be placed on what he said. He repeatedly brought the same plant under different names and applied the same name to various plants, which had not the smallest affinity. I have therefore been reluctantly compelled to wait, until I shall reside for some months near an intelligent physician or druggist, to whose knowledge of the plants I can trust.

A few other plants that are in common use remain to be mentioned.

1. The *Lawsonia inermis* or *spinosa*, Mehendi, are used by the Muhammedans of both sexes for colouring their hands and feet. The leaves beaten with a little Catechu are applied like a paste for a night, and the colour remains for about 10 days. These can scarcely be considered as different species.

2. The Panisuli, or *Phyllanthus Rhamnoides*, W. is a very common shrub, which produces a black berry. The juice of this gives a dark purple colour which is sometimes applied to turbans; but it does not last.

3. The *Mimosa saponaria*, or Amlokungehe, is common in the district, and its fruit is sometimes used in tanning; but the natives are not acquainted with the saponaceous quality, which occasions it to be in much request with more cleanly Indian tribes.

4. The Gaukungehi, or Changmolloti, small shrubby species of *Guilandina*, of which, so far as I can discover, no account has yet been published. Its pods are much used by the dyers of this district, and the people who collect them pay a revenue to the proprietors of woods.

5. The Sola is a plant much used both by fishermen, who employ it for floating their nets in place of cork, and by the makers of artificial flowers, who are numerous in Bengal. Their work is indeed coarse, but the material is excellent, and seems to be the same with that of which the elegant artificial flowers of China are formed. In fact, nothing can more strongly resemble the structure of the petals of a flower than the pith of the plant, which I am persuaded would be a valuable acquisition to our artists in Europe. It might even be worth while to send some home as a trial. This plant grows in tanks and marshes. The trunk, which remains under water, is three or four feet in length, and three inches in diameter. It consists almost entirely of a fine grained very light white pith, which has a considerable coherence of parts even when cut in very thin slices, and which can be dyed of the brightest colours. For making ornaments, the plant must be cut between the middle of October and that of November; what is procured after the marshes become dry is fit only for floating nets. Some confusion seems to have taken place in the Hortus Malabaricus concerning this plant:

APPENDIX III—contd.

the drawing (Part IV. tab. 18) seems to have been taken from the *Aschynomene Indica* of Willdenow, which the description, page 31 seems to refer to this plant, which is the *A. diffusa*, W.

6. The *Valisneria spiralis* is the plant used by those who refine sugar, in the same manner as clay is used for this purpose in Europe and America. The plant grows very copiously in the rivers that have a gentle stream, especially in the Jomuna. By the natives it is called Pat.

Plants used for feeding Silk-worms

The plants cultivated for supporting silk-worms are those of least importance in this district, if we consider merely the extent of ground which they occupy; but they are of considerable importance, if we estimate the value of the produce, and consider, that it affords the raw material for a valuable manufacture. Two plants are cultivated, the mulberry and *ricinus*, and these support two different kinds of worm.

The mulberry cultivated in this district is a dwarf plant, which I have had no opportunity of examining in a state fit for ascertaining its Botanical affinities. Its fruit is said to be black, and very small. The cultivation is confined to the banks of the Mohanonda, where a high free soil is chosen, and to those of the lower parts of the Korotoya, where a clay soil, chiefly that of a red colour, is mostly used.

On the banks of the Mohanonda the mulberry may occupy about 4000 bigahs, Calcutta measure, all within a mile of the river, amidst noble groves of mango, banyan, and *pipol* trees, which shelter the houses of those who rear the worm, and which would be delightful were it not for their slovenly condition. The plantations are surrounded by ditches and high banks of mud that form good fences, and ought to be secured from inundation, as this entirely destroys the plant, which otherwise lasts about 20 years. The Company's commercial resident makes advances for a great part of the cocoons; but as these are not manufactured in this district and as all that is manufactured on the left bank of the river is done by the farmers, who sell the raw silk, I shall proceed to give an account of the whole process. I begin with forming a new plantation of one bigah, for many do not exceed that size.

Collecting the leaves and pruning, ..	3 6 0
	7 7 10

The allowance for collecting the leaves I state on the following grounds. Many persons who rear the worms employ people to cultivate the plantation, and these

agree to deliver one-half of the produce, and to defray every expense. The sum of Rs.3 6. 0. is the difference between the expense and the average half of the produce.

There are annually six broods of worms, and the leaves are collected at six seasons; at three of these the plants, which grow about two or three feet high, are pruned, and the prunings are fit for feeding the worm. The leaves and prunings are sold by the load, which a man carries in a basket (*khungi*), that may contain about 80 lbs. weight, and according as the crop is plentiful or scarce, vary from one to 30 burthens for the rupee, which shows that the crops are extremely uncertain. The average price however throughout the year is four burthens for the rupee, which shows that the crops are extremely uncertain. The average price however throughout the year is four burthens for the rupee. The usual produce at each of the different crops is stated to be,

12th March, 11th April,burthens	8
11th April, 12th May,	6
13th June, 14th August, .	16
14th August, 14th September, .	8
15th October, 13th November, .	12
14th November, 13th December, .	10
Total	60 burthens

worth about 15 rupees. The profit on such land is therefore very great, and many people content themselves with this—sell the leaves, and rear no worms, but many more employed the leaves to rear their own worms, and no breeder trusts entirely to the market for a supply of leaves.

I shall now proceed to give an account of the manner in which cocoons are procured, a step of the process at which a great part of the cultivators stop. It is supposed, that a man and his family of the usual strength, that is a wife and an old woman, or child capable of assisting, can cultivate, collect the leaves, and feed as many worms as can be reared on four bigahs of land.

He must in the first place build a small hut with hurdle walls, and which has an aperture that serves for door and window. Every side except the door is surrounded by two or three rows of shelves that support the frames, lined with mats, on which the worms breed, feed, and spin. The whole value of the apparatus may be six rupees, and that of his house may be 10 rupees: allowing him to rebuild every four years the annual expense will be four rupees, and his ground rent will be one rupee. The total expense therefore of his accommodation will be five rupees. The eggs are placed on frames (*dala*), where they are to be hatched and fed, and the 240 burthens produced by four bigahs of land are sufficient to feed 240 frames of worms; when full grown, the worms are removed to other frames (*chondro*), where twigs are placed to facilitate their spinning. The worms of two *dalas* are placed on one *chondro*, so that there are 120 *chondros*, each of which should produce 2½ seers (88 sicca weight) of cocoons. The whole therefore should produce 7½ maunds, the usual price of which is 12 rupees the maund, or 90 rupees from the four bigahs. Deduct the expense of cultivation at Rs. 4-1-10. a bigah, and there will remain Rs. 73-8-8. Deduct farther the house-rent five rupees, and there will remain Rs. 68-8-8. or Rs. 5½ a month, which is a decent support for a family. Should the family keep more worms, the land would be cultivated by another person for one-half of the produce.

APPENDIX III—contd.

The people are so necessitous, that wherever they can procure advances for the cocoons, they always sell the produce of their plantations in that state; the profit however by spinning the silk is not inconsiderable. The cocoons that are intended for spinning are exposed to a strong heat, which kills the animal. The natives have almost entirely relinquished the original Hindu manner of winding the silk from the cocoons, by means of a small reel (*saya*), about 8 inches in diameter, which is fastened to a spindle, that the workman twirls round with his hands; and a larger reel (*ghayi*) moved by a wench after the European fashion is generally employed. Several people in this district have huts, in which there is one or two reels, each provided with a small furnace and vessel for containing hot-water, in which the cocoons are kept when winding. The instrument is let, by the day, to those who wish to use it. The price paid here for winding 2½ seers (at 88 sicca weight) is one anna for the implement, and two annas for two workmen that are employed, altogether three annas. On the 7½ maunds of cocoons produced by four bigahs of land, the expense of winding will be 22½ rupees. Every 2½ seers of cocoons produce 15 sicca weight of silk, altogether 1,800 sa. wt. usually worth 180 Rs. The value of the cocoons was 90 Rs. the expense 22½ rupees, altogether 112½ rupees, leaving Rs. 87½ or 33 per cent. for profit at the above rates. An acre of land, or three bigahs should produce 508 lbs of cocoons, worth 67½ Rs. 180 burthens of plant worth 45 rupees. The value of the whole produce may be 60,000 Rs of leaves, 90,000 Rs of cocoons, or 150,000 Rs. of silk, were it all wound in this district.

Near the Korotoya, the mulberry is cultivated in both clay and free soil, and I took the account of the cultivation in the former only. The people were uncommonly shy, and I have no great reliance on their statements.

The field is surrounded by a ditch and bank of earth as at Maldeh. The seasons differ considerably, although the expense of cultivation is nearly the same. The field is ploughed between the 12th of April and 12th of June, and the fence is made at the same time. The cuttings are planted in the following month, and weeds are removed about the end of August. Every year, with the early rains in spring, the field is ploughed and manured with dung and fresh earth. The plants are pruned close to the ground about the beginning of September, and the field is then ploughed, weeded, and manured. The young shoots push forth with great vigour, and about the middle of October are three feet high. In the ensuing month the leaves of the best quality are produced. In spring the same stems shoot forth new leaves, and these are gathered between the 13th of May and the 14th August. Those gathered in the middle of that period are reckoned of the second quality; those gathered at the beginning or end are of the worst kind.

The following estimate was given of the produce of one bigah in baskets, said to contain leaves weighing 25 seers of 96 sicca weight, or about 63 lbs.

Leaves of the first quality.....	baskets 24
2nd.....	24
3rd.....	22

70 burthens,

weighing Calcutta maunds 52½. The bigah at Maldeh of free soil gives 60 maunds, and is smaller, so that making allowance for this, the red clay would give only about 37 Calcutta maunds of leaves on the Calcutta bigah. The crop however seems to be more certain, as the price varies only from four to six bundles the rupee. The usual rate of nearly 10 Rs.

the Calcutta bigah, or one-third less than the produce of the land at Maldeh. Ten baskets are required to feed two frames of worms are placed into one, when they are about to spin, and this one produces four seers (96 sa. wt.) of cocoons, so that one frame on the Korotoya produces 394 sicca weight of cocoons from 300 Calcutta seers of leaves, while on the Mohanonda a frame produces 220 sicca weight of cocoons from 160 seers of leaves. The leaves therefore on the banks of the Mohanonda are not only in greater quantity, but are more nutritious than on the Korotoya; for 300 seers of them would have produced 412½ sicca weight of silk, or about ¼ more than the produce near the Korotoya. The bigah produces therefore 28 seers of 96 sa. wt. of cocoons, which at the Calcutta weight and measure is rather more than 23½ seers for the bigah, or very little more than one-half of what was stated at Maldeh. It must however be observed, that the soil is of a different nature, and I had no opportunity of ascertaining what the free soil near the Korotoya can produce. It is also probable that the people under-rated very much every part of the produce; for although they stated the seer of cocoons to be 96 sa wt. yet there is the strongest ground to suppose that in reality it weighs 160 sa. wt. I conclude this to be the case from the farmer's stating, that they sold their silk at eight rupees a seer of the same weight with the seer of cocoons, and I know from the commercial resident, that the seer of silk which sells at eight rupees contains 160 sa. wt. It is extremely probable therefore, that the calculation requires to be corrected by taking this rate of 160 sa. wt. for the seer, in place of 96 sa wt as stated by the farmers. This will make the produce, reduced to the Calcutta weight and measure, about 40 seers of cocoons from the bigah, which is nearly the same with the produce at Maldeh. The cultivators state, that 28 seers of cocoons give 2½ seers of Bengal silk, worth 21 rupees; the rent is two rupees, the expense of winding Rs 2.10, and of cultivation five rupees, leaving a net profit of Rupees 11.6.0. Mr. Monkton states, that cocoons give ¼ of their weight of silk, which would make their profit considerably greater. The cultivators say, that they have refused thirteen rupees for the maund of cocoons at seventy-six sicca weight the seer. The price offered is higher than that usually given at Maldeh, where the maund of 88 sicca weight the seer sells only for 12 rupees.

The whole value of the leaves produced near the Korotoya may be about 30,000 rupees; that of the cocoons has not yet been fixed.

The *Ricinus* (Eronde of the natives) is raised in many parts of this district for feeding a silk-worm, which I take to be the *Phalacna Penelope*. There are two kinds of the plant, the *Ricinus communis* and *viridis* of Willdenow. This excellent Botanist has with great propriety changed the name given by Linnæus to the first species; but with regard to the last, he has been uncommonly unfortunate as the stem of the plant is of a bright red, and the leaves are stained with brown, so that it may be considered a very remarkable exception to the vegetable colour. Being green, both plants seem to answer equally well, and those who rear the worm drop a few seeds round the fence that encloses their farm-yard, or sow a small spot adjacent to their house. The seed is put in the ground about the beginning of November, and again about the beginning of May.

Both plants are annual, although they have strong woody stems of ten and twelve feet high, and they live about eight months, so that leaves are procurable at all seasons. The seed is sometimes made into oil for medicine, but is never used for the lamp, as in many parts of India. The plant requires a mixed free soil. In some places one brood only of worms is reared; in others 12 broods spin silk in the course

of the year. The cocoons preserved for breeding having produced moths, which are very beautiful, the impregnated females cling to a small twig that is hung up near them, deposit their eggs round it in spiral rings, and there die clinging to the stick. These twigs are often sold at markets, and with the dead moths hanging round make a very curious appearance. A breeder, having procured one of these twigs, scrapes the eggs into a piece of cloth which he lays on a wide-mouthed basket, which is supported at some distance from the floor in one end of his hut. The eggs are soon hatched, and the worms are daily supplied with fresh leaves, and kept clean. The worm grows rapidly, and when ready to spin, some twigs are put into the basket to assist its operation. The cocoons that are to be spun are thrown into boiling water, and the threads of from five to six are wound into one by means of the common silk reel of Bengal. This forms a coarse rough thread of a dirty white colour, and totally destitute of the silky lustre. A seer of 96 sa. wt (lb. $2\frac{1}{3}$) of this thread is worth from 12 annas to one rupee, but it is very seldom sold, and the people who keep the insect in general rear no more than is just sufficient to make clothes for their own family. The cloth lasts very long, owing to which quality, it is probable, that some use might be found for this material in our manufactures at home. It would perhaps answer as an ingredient for mixing with wool in the fabrication of many kinds of cloths, and I think it might be of use to send home a few hundred weights, which might be distributed among the principal manufacturers, in order to discover whether or not it could be applied to use. I have no doubt, if advances are made, that large quantities would be procured at 12 annas for the seer, or about five annas for the pound, so that it might be sold at 18 or 20 pence a pound in England, with a reasonable profit.

At present about 1000 bigahs may be occupied with the Erondo plant.

VII

STATE OF ARTS AND COMMERCE IN
DINAJPUR

The style of private edifices, that is proper and peculiar to Bengal, consists of a hut with a pent-roof, constructed of two sloping sides, which meet in a ridge forming the segment of a circle, so that it has a resemblance to a boat when overturned, and is probably of the same shape with the Mapalia of the Numidians. This kind of hut, it is said, from being peculiar to Bengal, is called by the natives Bangola; a name which has been somewhat altered by Europeans, and applied by them to all their buildings in the cottage style, although none of them have the proper shape, and many of them are excellent brick-houses, adorned with the forms of Grecian architecture.

Among the natives, the poor man has one hut for himself and cattle and richer men increase the number without altering the plan of the building, and there is no contrivance by which a person can go from one apartment to the other, without being exposed to the sun and rain.

Where the materials admit, the walls of the hut are made of mud, and the floor is always raised a foot or two above the level of the plain, but not always so high as to be above water in the rainy season; so that a platform of bambus is then constructed at one end of the hut, and upon this the family sit and sleep, while they must wade through the mud to reach the door. Where the soil is too loose for making walls, the sides of the hut are formed of hurdles, which are usually made of straw, grass or reeds, confined between sticks or split bambus that are tied together. In the better

kind of houses, in place of straw, hurdles made of mats are used, or those of straw are plastered with dung and clay; and in doing this the natives display the only neatness, that is to be observed in their buildings. The frame of the house usually consists entirely of bambus tied together. It is only in the houses of very wealthy persons, that wooden posts and beams are used; and these are never either polished or painted, and seldom fastened by nails.

Sometimes the beams support a floor made of clay laid upon bambus, and in general this is merely intended to lessen the danger from fire, as the floor will give some little time for the people to remove their children and effects. In a very few houses a trap-stair leads up to the apartment or garret above, and it is then inhabited.

The door is in general the only aperture in the hut, crevices excepted, and is usually shut by a hurdle (*Jhangp*), which is tied to the upper part of the door, and falls down like a valve. Wooden doors that fold from the side, are only used by the great. There are very few houses, that have any openings like windows to admit air or light.

If the house is intended for a shop, one side of the roof is extended four or five feet beyond the wall, is supported by a row of bambus, and forms a gallery (*Hatina* or *Osara*) which serves as a shop.

Another kind of hut, called *Chauquari*, has been introduced, and this is the form which Europeans have adopted in their cottages, when they use a thatched roof. It consists of four plain sides, which, if the building is square, are triangular, and meet in a point, but if the cottage is long, the two ends of the roof only are triangular, and the two sides (which are triangles truncated at the apex) form a straight ridge. Europeans have made great improvements on this kind of buildings, have surrounded it with a gallery to exclude the heat, have introduced windows, have divided it into convenient apartments, and have suspended cloth ceilings to free them from the vermin that occupy the thatch. These luxuries seem totally unknown to the natives of this district. Their *Chauquaries* are built of the same materials with their Bangolas, but being used chiefly among the rich, have usually wooden posts, and many of them have garrets that are inhabited, and have openings by way of windows.

The wealthy, such as great landholders and principal manufacturers, have in general brick-houses, and are fast imitating the European fashion of building, such as has been introduced into Bengal. It is alleged in the Ayeen Akbery, that in the time of Akber, even the houses of the great in Bengal were built entirely of bambus. I am inclined, however, to doubt the authority of Abul Fazil in many things, and among others in this. That the great in Bengal may have then built Bangolas entirely of bambus, with great neatness and very commodious, is highly probable; but that they had not also brick houses is not likely. In fact, tradition points out the ruins of brick edifices, that belonged to the natives of this district before the Muhammedan invasion; and the appearance of some of these ruins clearly indicates that they were dwelling houses, and neither temples nor forts. In the older brick-houses, the Moorish style, with wretched narrow steps rather than stairs, low roofs, small apartments, much minute carving, and small windows has been adopted. In some new houses a rude imitation of the Grecian architecture makes its appearance; the rooms are larger and better aired, and more furniture has been introduced.

Among public edifices, those dedicated to religion are by far the most conspicuous. In my account of

APPENDIX III—contd.

Peruya and its antiquities, I have mentioned nearly all that occurs to me concerning the religious buildings of the Mohammedans: small mosques are numerous in the district, and consist of a cube covered with one dome, or of a parallelopiped covered with several. The minaret, which is the greatest ornament in this kind of building, has not been introduced, and the whole style may be considered as in the most rude state.

The most numerous and simple Hindu places of worship are called the *Sthans*, or abodes of such or such a deity, and are merely heaps of earth or square terraces which are generally placed under trees. Sometimes as an object of worship, there is an uncut stone, at others there is an image cut in relief; but very often the only representation of the Deity is a small mass of clay, a little painted. Most of these places being dedicated to the *Saktis*, or female destructive spirits, a stake is placed before the heap, for fastening the head of the animals, that are to be sacrificed.

A more improved place of worship consists of a thatched hut, called a *Mondop*. In the greater part even of these there are no images, except a lump of clay, and at holidays a rude image is made of the same material, and is thrown into the river, when the festival is at an end. The walls of these huts, when made of clay, are often painted with rude and horrible figures of the gods, and equally distorted representations are formed of the *sola* by the makers of garlands and artificial flowers; but both are considered as merely ornamental, and are not objects of worship. I have seen one building of this kind, which was said to have cost 16,000 rupees. The size was inconsiderable, but the walls were made of wood, carved with a most patient minuteness, in which however neither taste nor decency had been at all consulted.

Near many of these *Mondops*, and even near many houses, for the worship of the family gods, are erected the most rude form of the *mongchos*, or stages on which the images are placed on the (*Yatra*) days of procession, while the people sport before them. These simple *mongchos* consist of a small square terrace of earth divided into stages each less than the one below.

The next step at improvement is to construct a *Mondop* of brick for the usual residence of the deity. This is commonly a small square building with a flat roof. A temple of this kind has seldom any other *mongcho* than one of earth; but it has usually an image that is the object of worship, and commonly a house for the *Pujari* or officiating priest. The most elegant in the district, that I saw, is at Yogighopa, of which a drawing has been given No. 11. This is open above; the image is placed on the small altar seen through the door, and is covered by a dome.

The next step is to add a kind of pyramid to the roof of the temple, which then becomes a *Mondir*. The *Mondirs* are often cased with carved tiles, and at any rate are plastered on the outside, and the ornaments on the plaster in general possess some taste. Many *Mondirs* built of late, instead of the pyramid, have adopted the dome of the mosque, probably because workmen skilled to construct the pyramid could not be readily procured.

Advancing still further, the temple for the usual residence of the image is enlarged, and in addition to the central pyramid one is added at each corner, and the building is then said to be a *Pongchorotno*, or to have five ornaments; or, if enlarged a little more, the roof is divided into two stages, each having a pyramid at each of its corners. It then becomes a *Novorotno*, or building of nine ornaments. Such buildings are very

expensive, as in this district they are almost always incased with carved tiles. The accompanying drawing (No. 36) of a *Pongchorotno* at Gopalganj near Dinajpur, built 75 years ago, by the mother of Raja Ramnath, will give a better idea of the style than any description. Only it must be observed, that, in buildings so frittered away into minute ornaments and parts, the drawing looks much better than the building itself, especially as no Hindu temple that I have seen wretched; there is no light, except what comes through the door, and the masses of brick, that are necessary to support such a roof, leave scarcely any cavity.

The first step towards improving the *mongcho* is to build it of brick, in several decreasing stages, nearly of the same form with that made of earth. A stair leads up to the highest stage, in which a small apartment is made for receiving the image at processions.

The next improvement is in each stage to have chamber surrounded by a gallery, in which there are several doors or windows. Then at each corner of each stage a *rotno* or pyramideal ornament is added. The most finished kind consists of 12 sides with 24 *rotnos*, disposed in two rows, and one in the centre over the apartment in which the image is placed. The drawing of the one at Gopalganj (No. 37) will give a proper idea of this kind of building. Although it is of a considerable size, and cost an immense sum (it is said £20,000), there is no apartment in it above 12 feet in its greatest dimensions, and the stair is steep, perfectly dark, and will not admit a man to walk with both shoulders equally advanced.

The temples here and in the south differ entirely in structure, the latter approaching much nearer to the Grecian or rather Egyptian style. This is probably in a great measure owing to the nature of the material; for the long masses of granite, so easily procured in the south, lead naturally to columns, flat roofs and entablatures, while bricks lead to arches and pointed roofs. The style of ornament, however, is nearly the same in both parts of India. Some neat foliage possess considerable merit; the rest consists of numerous small mouldings, and monstrous distorted representations of the deities and their adventures, among which obscene figures are often a conspicuous part.

The number of public edifices of a civil nature seems never to have been considerable. One inn (*serai*) at Maldeh now in ruins, and a few small bridges form the whole. The bridges have very small arches, and none are employed on any thing like a river, they have been merely made over rivulets.

The fortresses seem to have been equally rude, and to have consisted in a straight rampart and ditch with a few outworks at the gate. The only one that appears to have been more strongly defended is Uttor Gogriho, as I have already mentioned. The number has always been inconsiderable.

The accompanying plan (drawing, No. 36), drawn by the chief architect in the district, of the house and buildings of Baidyonath Chaudhuri, who took a pleasure in shewing me all his works with the utmost politeness, will show the progress made in this branch of science.

Wishing to know, what skill he might have in geometry, I requested him to show me how he laid down the foundation of an octagon building, such as are in common use. He had a pair of ruinous European compasses, and a square, but no rule nor scale; and I soon found, that the others might as well have been omitted in his apparatus, and were designed merely for shew. His only scale was his arm, his only ins-

APPENDIX III—contd.

truments a line and some pegs. He began by measuring off four equal portions of the line, fixing a peg at each; he then placed these in the ground so as to distend his four portions of rope into a parallelogram. He then moved the pegs backwards and forwards, until his diagonals were equal, he then divided each side into four equal parts, which he found by doubling one of the sides twice. He then truncated each angle by passing a line between the division next it on each side. He thus had an octagon, but four of the sides were shorter than the others. This objection having been made, he said, that the four alternate sides having doors in them ought to be larger, otherwise the building would not look well; but being desired to make all the sides equal, he went round, adding small equal portions to each alternate short side, until he found by experiment, that he had succeeded. He looked upon it as impossible to lay down an octagon, that should have all its sides equal, and each side of a given size; all he attempted was to lay down an octagon within a given square. He said, that he could also lay down any figure of an even number of sides,—figures of an uneven number of sides, such as pentagons, he considered as far beyond human skill.

Sculpture and statuary are in a still more rude state than architecture. The figure of *Gones*, which accompanies this account (No. 1) will serve to give an idea of their stone images, and this is reckoned very handsome. There are however many stones, on which images of the gods of small dimensions have been carved in high relief, and these are a good deal superior to *Gones*, although they are still very rude imitations of human form, and are said to have been brought from the west of India many ages ago. One of them is represented in No. 12. The carvings on tiles, with which many of the religious buildings are incrustured, are still more imperfect. The images of brass and the metals are as bad as those of stones, and some which are made of potters-ware, much more rude than I could have conceived, that any grown up person could have formed.

Painting is still at a lower ebb than sculpture.

To the ear of a European the native music appears in general harsh and disagreeable, and to men of science it is altogether intolerable. Although I am not at all nice, I confess, that I was much satisfied in travelling through the district to find, that the people had less turn for this pleasure than is usual among the natives, and I cannot say, that in any other part of the country I was ever so little disturbed by its noise. The performers notwithstanding are pretty numerous, and the variety of noises, which they can make, is considerable.

The highest description of musicians consists of bands of instrumental music, which accompany the voice of girls who sing and dance. In this district there are very few persons of this kind, and they do not exceed 20 sets. The two Hindu castes who follow the profession, the *rumjari* and *kangchou*, have not found their way from the west of India to this district; and those who follow it at present are common prostitutes, that have learned to sing, and employ musicians to accompany their voice. As usual, their motions in dancing are slow, lifeless, and without grace; their greatest art is to jingle in time to the music, some chains (*ghungru*), which are tied round their ancles. The girls are called *bayi*, and there are usually two or three in a set. The musicians, called *somaji*, are three or four in number; one performs on a small drum (*tubla*), the others on a kind of fiddle (*sarangi*).

Boys taught to dance and sing, and dressed in an effeminate manner, are in great request among the Hin-

das, and about 20 sets are employed in Maldeh and its vicinity, where the people are most luxurious. In other parts of the district there are no such persons. These boys, called (*bhotiyas*), are usually suspected of very disgraceful practices; when they grow up, they perform on the musical instruments that belong to the set, which are the same as when girls dance or sing, only another kind of fiddle called (*sarinda*), is sometimes used.

Most of the other musicians belong to sets, that are employed in religious ceremonies.

The sets of musicians who sing the praises of *Bishohari*, the goddess of snakes, or who are called *Monggol* (*Chondi*, or who sing the praises of Mahummedan saints (*Pirer Gayon*), usually consists of seven or eight persons; chief or *sudar*, who has a Tibet cow's tail (*chamor*) in one hand, and a pair of small cymbal (*mondira*) in the other; six *pai* or assistants have small cymbals in their hands, and tie round their ancles, rings of bell metal, which make a noise as they dance. One boy is often kept to sing and dance; but not always. All these persons sing and dance; but two others (*bayen*) beat on large drums called *mridongs*. In this district there may be 350 of these sets.

There are probably about 150 sets, which sing the praise of *Kushno* (*songkerton*). Each consists of a chief, who has a small drum (*khonjuri*), or a pair of cymbals (*korotal*), and of three or four (*pai*) assistants who use cymbals, and of one or two (*bayen*) drummers, who beat the *mridongs*.

Some persons (*zari*) during the Moharram, are employed to sing the praises of Fatima, the daughter of Mohammed, and of her unfortunate sons Hoseyn and Hassan. They are not accompanied by music.

It is however at marriages, religious processions, and such great solemnities, that the full din of music arises, and that a herd of the lowest dregs of the people are employed to rend the ear with these formidable implements of noise.

1 <i>Dhol</i> ,	} Drums.	9 <i>Kangsi</i> or gongs.
2 <i>Tikera</i> ,		10 <i>Sanaji</i> , a kind of hautboy.
3 <i>Dhak</i> ,		11 <i>Singga</i> , or buffalo's horns.
4 <i>Madol</i> ,		12 <i>Turi</i> , or brass trumpet.
5 <i>Dogor</i> ,		
6 <i>Kara</i> ,		
7 <i>Jorghayi</i> ,		
8 <i>Nagara</i> ,		

Every man makes the most of his instrument, and pays little or no attention to his comrade's.

Men often amuse themselves by singing hymns of love songs, accompanied by small drums (*dholok*, and *pakhoyaj*); but it is considered as very disgraceful for a modest woman to sing, or play on any musical instrument. The only time when such a practice is admitted, is among the Mohammedans at the Moharram, when women are allowed to join in the praises of Fatima and of her sons.

A kind of men called *akras* are strolling musicians, and sing hymns and love songs to the rich, and accompany their voice with a pair of small cymbals (*mondira*), with the small drums called (*dholok* and *pakhoyaj*) or with two kinds of guitar (*tombura* and *setar*). Many young men, for amusement, play on these instruments, and accompany them with the voice.

1. Washerman are not so numerous in this district as in many others. The people are in general either too poor or too slovenly to employ them, and it is

only persons in easy circumstances, that use bleached linen. The common people occasionally go into a tank or river, and wash the clothes in which they are dressed; for in general they have little change of linen. In this district the washermen use chiefly ashes, and they have no contrivance, such as a hot iron or a mangle, for making the linen smooth. The bleachers in the district are those employed by the Company at Maldeh. The common washermen are almost all Hindus of a very low tribe. They have no capital. In the whole district there may be about 650 houses, of which 250, including the Company's bleachers, reside in Maldeh. All are paid by the piece. The bleachers make high wages, five or six rupees a month; but the common washermen do not earn about 1½ rupee.

2. Almost all the tailors are Moslems, for the needle seems to have been totally unknown to the Hindus. In this district, although the Mohammedans are numerous, the tailors are few in number and little employed, for the lower Mohammedans have entirely adopted the Hindu dress, and wrap their clothes, round them as made by the weaver. The higher Hindus, on the contrary, have in a great measure adopted the Mohammedan fashions, especially those who are employed in office, or when they visit European gentlemen; and the tailors are chiefly confined to the towns at Dinajpur and Maldeh, in which there may be rather more than 100 families, and perhaps an equal number is scattered through the district. They have no capital, and usually work by the piece. A family, for the women also sew, may however earn four rupees a month, which is a decent subsistence.

3. All the barbers are Hindus, and are a pure tribe, and pretty numerous, for in this district there are between 1,000 and 1,200 families. They attend at all markets, where they shave and cut the nails of those who employ them. The usual hire is 10 *gandahs*, or about the eighth part of an anna. Farmers and labourers shave only once a month, and generally pay the barber in grain. Rich men often keep barbers as servants, both as they are pure, and as they can shave them, pick their ears, cut their nails, knead their bodies, and crack their joints, of which operations the natives are very fond. A servant of this kind is allowed one rupee a month, and food and clothing. Those who work by the job make tolerable wages, and live easily. They shave without soap. Persons after mourning are shaved and pay liberally; so do also bridegrooms on the day of their marriage, as on that important occasion particular pains must be taken. Ten days after a woman has been delivered, the nails of both her and the child are cut by the barber. No native woman in Bengal, except a shameless prostitute, will allow her hair to be cut, such care of her person being deemed incompatible with modesty.

4. In Dinajpur a few people are employed in making a tooth powder called *misri*, this is composed of the *Myrobalans* called *Bellirica* and *Chebula* by Gærtner (*boyera* and *horitoki*) of two other fruits called *majuphal* and *toi*, of green vitriol sulphate of iron, and of iron filings. It is reckoned to strengthen the gums, and when applied in a certain manner with beetle, and some other substances, it renders the teeth entirely black, which is considered as an ornament. The persons who make this powder are usually poor old women.

5. The married Hindu women use red-lead as an ornament; but instead of painting their cheeks, like our belles, they rub it on their foreheads. This piece of vanity is not permitted to widows. The destructive female deities however, consume a considerable quantity, as a present of this kind is supposed to be agreeable. In this district there are two persons who manufacture this pigment (*sindur*), but I had no opportunity of examining their process. I understood, however, that

they were poor and unskilled in their art. Their capital was supposed not to exceed ten rupees.

6. Female ornament gives employment to a great many other artists. Among these are the persons called *Lahari* or *Luri*, who make rings of shell-lac, which the Mohammedan women wear round their arms, and which are called *churi*. They are of various colours, and are in fact a hard sealing wax. The sealing wax indeed that is used in Bengal, is commonly made by the *Lahari*, for in a warm climate the European kind is useless. The people employed in this way may occupy 100 houses. Four or five rupees are a sufficient capital. They can make about two annas a day, or four rupees a month.

7. The Hindu females use bracelets made of shells, and thus gives employment to many people, who are called *Songkhobonick* or *Saukhari*. Of these there may be almost 200 houses in the district. The shells are brought from Calcutta by a merchant of Kumar-khali, and are cut, polished, and painted by the artists of this district. These require a capital of at least 50 rupees; and a few are rich, as they have a stock of four or five hundred rupees, with which they purchase many shells and employ labourers to work by the piece. The shell is cut with a semicircular saw, and polished by rubbing it on sand-stone. The workmen are very inferior to those of Calcutta; but no tradesmen in the district make better wages, nor have large capitals. They make their goods chiefly without being commissioned, and retail them for ready money in their shops, or give them to petty traders, who retail them at markets. A pair of bracelets costs from one to seven rupees.

8. All Hindus must wear beads, and those of Vishnu's side ought to wear such as are made of wood, or of various seeds. The people who make them are religious mendicants, so that would be difficult to separate the profits of their two professions. The number in the district may be about 100 houses.

9. The makers of garlands, of artificial flowers, and of ornaments prepared from the *sola*, (*Malakar*), are a numerous class; but very poor. In this district there are probably near 300 houses. They form garlands of flowers, which they collect partly in the fields, and partly from gardens. These are sold, and are used by the wealthy both for pleasure, and as offerings to the gods. The *sola* I have already described. The ornaments made of this plant are very gaudy, being stained with glaring colours, and mixed with tinsel; but the workmanship is very rude. The same artists make numerous ornaments, that are used as toys by children, and at all processions, and that are suspended in places of worship. Some are very large, such as the biers which the Mohammedans carry about on the Mohurram, and the stages on which the Hindus place their images at the *pujahs* of *Durga*, *Kali* and *Kartik*. All these are committed to the waters, when the ceremony is over, so that on each occasion the artists find new employment.

The colours which these people employ are orpiment, vermilion, white-lead, red-lead, verdigris, and a white talcose earth called *Kori*, which is brought from the west of India, and is similar to that which is prepared at Molicotay, of which I have given an account in my travels into Mysore.

The garland-makers use also ink, such as is employed by the natives, and the best kind is prepared as follows:—Take twenty sicca weight of rice, parch it in a pot, until it becomes quite black; put it into 60 sicca weight of cold water, and allow it to remain a quarter of an hour. Then pour off the water, and mix it with lamp-black, by rubbing it in an earthen pot

APPENDIX III—contd.

with a stick or wooden pestle. One sicca weight (179½ grains) of lampblack is sufficient. For fine writings a little gum of the *Mimosa Indica* (trees No. 59) is added. What is commonly sold in shops, however, is made of soot in place of lamp-black.

The garland-makers use also some vegetable dyes. The inner bark of the *Nyctanthes arbor-tristis* (trees No. 16), is beaten in a mortar. Its juice is expressed, mixed with lime, and by means of a brush is applied to the *sola*, to which it imparts a red colour.

Another red is prepared by 12 parts of the same bark, with 16 parts of the inner bark of the *Artocarpus* (trees No. 103), and eight parts of water. These are well beaten, and then the water is expressed, and used as a dye.

The glue which these artists employ is made by boiling the inner bark of the tree, No. 107, then beating it, and expressing the water, which has a glutinous quality.

The tinsel which these artists use is partly tin-foil of various colours, and partly plates of Mica.

10. In many districts those who make the mats, on which the natives sit and sleep, and who make umbrellas, form a class that contains a considerable number of artists. In this district, however, I heard only of five houses at Dinajpur, who could be considered as belonging to this profession, and their work is very coarse.

The art of making an umbrella, that can be folded, is here quite unknown, and indeed seems to have been equally so in every part of Bengal until introduced by Europeans at Calcutta. In this district almost the only mats that are made are composed of a species of *Scirpus* called *Nagomatta* (see reeds, No. 13). The stems are split and interwoven, and form a mat which is soft, but destitute of neatness. Poor people make them at their leisure hours. The umbrellas that are most commonly used, are made by the next class of artists.

11. The *Patoni*, basket-makers, or workers in bambu and ratan, are a very low tribe of Hindus, who are however both useful and numerous. In this district there may be from 1,000 to 1,200 families. They are miserably poor, and do not require any capital; for two or three annas will buy more materials, than a family can work between one market and another. Both men and women are equally capable of working the baskets, and both carry them to market, where in general they sell them for ready money; the women however, take the greatest share of this trouble. Their poverty is chiefly owing to their lavishness; for they are much addicted to intoxication. It is however a good deal alleviated by their keeping swine, which afford them a wholesome nourishment.

The goods which they usually make, are as follows:

1. *Chupri*, baskets for carrying provisions.
2. *Jhuri*, baskets for carrying earth or manure.
3. *Dhuchuni*, baskets for washing rice.
4. *Dala*, flat baskets used in shops for holding cowries or goods, and for carrying fruit and vegetables.
5. *Dal*, large close wrought baskets for preserving grain.
6. *Kula*, fans for winnowing corn.
7. *Chaloni*, serves for cleaning grain or flour.
8. *Dox*, hemispherical baskets wrought very close, which serve for measuring grain, and among the poor as vessels, for eating and drinking.

9. *Petara*, baskets with lids, which serve for trunks.

10. *Jokoyi*, fish traps.

11. *Pinjora* or *Khancha*, bird-cages.

12. *Jharu*, brooms.

13. *Chatayi*, mats, made of bambus which are split on one side, and then laid open into a kind of thin planks, which are interwoven so as to form the mats. These are the principal article in demand, and the only one that is exported. In all good huts these mats are placed over the frame of the roof under the thatch, and, where there is not a clay soil, they form the side walls. They also are used in the fence, which enclose the yards of those who are in easy circumstances, and in all boats they form the roof to exclude rain, the cover of the platform on which the people work, and the donage by which the goods are kept dry. The demand is therefore very great. These mats are of two kinds; one four cubits by three, which at Dinajpur cost four rupees a hundred; the others are two cubits by one and a half, and sell for two rupees the hundred. These people make also the umbrellas, of which almost every family in the rainy season has one or two. The top consists of a double net work of split bambus, which confines leaves of the *sal* or of the banyan tree for turning the run. This head is fastened to a bambu handle, the upper end of which is split, and the divisions separated so as to render it more easily fixed. The whole is extremely rude.

These goods are always prepared by the *Patonis* for sale; but if required, they can make many others: such as fine and coarse screens (*chuk* and *chali*), chairs (*Chauki*), and stools (*moras*). In some parts they are employed to make the bambu frames of houses, but in most parts this operation is performed by the common farmers, and by their servants. In some parts also they thatch, which art in many districts is considered as a separate profession (*ghorami*); but in the greater part of Dinajpur every man thatches and builds his own house, either with his own hands or by means of his servants. The (*chatiya*) or mats are the only articles, in which the artists of Dinajpur excel, and that seems to be chiefly owing to the goodness of the material. The mats made in most parts of Bengal consist of reeds; but in Dinajpur they are made of bambus. The demand for them is often so considerable, that merchants are under the necessity of making advances, for in this country no considerable quantity of any one thing can be procured to purchase for ready money.

12. Paper is made entirely by Mohammedans, who seem to have introduced the art. Before their arrival the natives in their writings appear to have used only the leaves or bark of trees. In this district there are between 80 and 100 families employed in making paper, and they are nearly adequate to supply the demand. The quality is very inferior even to that made near Calcutta. It is brown, rough, uneven spotted, fibrous, full of holes and brittle, ink sinks into it, and insects devour it with avidity. The people who make it are in decent circumstances, and require little or no capital. They usually carry it to the markets just as made, and petty traders buy it from the manufacturers by wholesale, and afterwards retail it. The sheets are usually 24 inches long by 16 wide, and are doubled twice; 24 sheets form a quire, and the manufacturers usually sell 10 or 12 quires for a rupee.

The material is the *pat* in its rough state. A sufficient number of bundles is thrown into a large jar, that is sunk in the ground, and they are covered with a mixture of lime and water in which they are allowed to soak for from two to nine days, according to the heat of the weather; the hotter that is, the less time being required. The bundles are then dried, and the lime that adheres is separated from them by beating

APPENDIX III—contd.

and shaking. They are then moistened with water, and beaten with a *dhenki*, which has a cap of iron, and falls upon a stone slab. While it is beating, the *pat* is occasionally moistened, until it is reduced to a kind of pulp. This part of the operation, which is the only one attended with labour, is performed entirely by the women. The pulp after coming from the mortar is thoroughly washed, and a portion of it is thrown into a wide-mouthed vat made of potter's-ware, that is sunk to the level of the yard. A large proportion of water is added, and they are stirred until the pulp is properly diffused; but little pains is bestowed on this, which seems to be the chief cause of several of the imperfections that are in the manufacture. In fact the pulp, with a very little stirring, is allowed to soak four or five hours, and is then wrought into paper. The workman's mould is made of bamboo split fine, and tied together parallel to each other, and this is extended by a moveable frame, made also of bamboo which serves as a ledge to confine the pulp. The workmen holding his mould with one hand stirs up the pulp with the other, then immerses his mould, and takes up a quantity sufficient to make a sheet. When he has allowed the water to escape, he lays aside the frame, and turning over the mould places his new sheet of paper above those that he had previously made, and he repeats the operation, until the pulp in the vat is exhausted. In this heap the paper is allowed to dry. It is then taken sheet by sheet, and immersed in a decoction of starch made of rice, and having been dried is placed on a smooth plank, and rubbed with a round stone. This is to serve instead of hot pressing, and in some measure effaces the marks of the mould, and renders the side of the paper that is next plank tolerably smooth. The stone that I saw was a water worn piece of granite, far from being polished.

13. In one division I found three men who lived by binding books, such as are used by the natives for keeping accounts; these books are usually about 16 inches long, 6 inches wide, and 1 inch thick, and are stitched together at one end like some old books of music. The cover is usually made of coarse red cotton cloth. The learned still adhere in general to stringing the leaves of their books on two threads, which pass through the middle of each sheet; and through two boards that serve for a cover. This mode, which was fit for books made of leaves, is exceedingly awkward and destructive with paper; but old habits are difficult to eradicate, and proper binding is making daily advances.

14. The manufacture of leather is by no means so thriving, as it might be made probably owing to the very low rank of the artists. These are of three kinds: the first, and by far the most numerous, are called *muchi* and *chamar*, and are tanners and saddlers and make shoes and trunks. In the whole of this district there may be about 200 houses of these artists.

The hides which they dress are those of oxen or kine that have died a natural death, and those of goats and sheep. The Hindus here use the skin of the ox without scruple, although strictly speaking, this is contrary to law. Buffalo hides, and the skins of deer and of the wild hog, are unaccountably neglected.

Neat's hides are first put into lime and water to separate the hair, they are then washed. Take a pot, put into it five seers (96 sa. wt. 124) of powdered leaves of Lodhi (trees, No. 80), and an equal quantity of water; then put in two washed skins, and let them remain two days. Then in two other pots repeat this process on the same skins. The skins having been thus tanned are dried, and are beaten twice in a wooden mortar, each time having been previously moistened with water. The skin is of the usual brown colour of tanned leather, and may be made black by rubbing it with green vitriol. It serves for the soles of

shoes, and for covering the baskets with lids, which are called *petaras*, and which are used in place of trunks. Raw neat's hides cost $\frac{1}{4}$ of a rupee; the artists cannot tell the weight, but they are small and thin. When dressed they sell for $\frac{1}{4}$ of a rupee.

Goats' skins are those mostly used. Each costs $\frac{1}{8}$ of a rupee, and when prepared sells for $\frac{1}{4}$ of a rupee, if dyed red, white, or yellow; and for $\frac{1}{4}$ of a rupee, if stained black or brown. In order to separate the hair ten of them are put in a pot with some lime and water, and allowed to remain there from 25 to 30 days; each skin requires above a pound of lime. The ten skins, when freed from hair, are washed and put in a pot with about ten seers (lb. 24 $\frac{1}{2}$) of the unripe pods of the *Gulandina* called *gaurungchi*, which have been beaten in a wooden mortar with about 20 seers (49 $\frac{1}{2}$ lb.) of water. After standing two days they are put into an equal quantity of fresh tan of the same kind, and then they are dried. They are afterwards twice beaten in a wooden mortar, having been previously moistened with water. The skins are then fit for the upper leathers of shoes and are of the common tanned colour, which may be changed into black by a little green vitriol. If red skins are wanted, they must be dyed with lac, before they are put into the tan. Skins may be made of a dirty orange or reddish yellow by rubbing them, when newly taken out of the lime, with the inner bark of the *dequo*, (Trees, No. 103), beaten into pulp with a little water. White skins are prepared, without tan, by rubbing them with salt, after they have been taken out of the lime and then beating them. The only good colours are the black and red.

Sheep skins are treated exactly in the same manner. The whole of these operations usually conducted by the women, as being the most laborious; but the hides are very badly dressed, as may be readily imagined from the account that I have given.

The shoes, trunks, and saddles are made by the men. A man and his wife can prepare eight pairs of shoes in a month, and these sell from $\frac{1}{2}$ to $\frac{3}{4}$ of a rupee a pair. The shoe-makers have little or no capital, but make tolerable wages or about 3 rupees a month, which would enable them to live decently, were they not violently addicted to intoxication. Every native, that can afford it, wears leather shoes.

15. A class of people called *Kurail* make leather bags, (*kappa*.) in which boiled butter, oil and molasses are kept. They live chiefly in the divisions where sugar is made, as the demand for their bags is principally to contain molasses. There are between thirty and forty families of this kind. They use the hides of buffaloes, and are nearly in the same condition with the shoe-makers. I did not learn their process.

16. The great variety and number of drums, used in this district, would employ a considerable number of people to make them, did not most of the performers construct their own instruments. I heard only of 15 houses, of the low caste called *Bade*, who lived by this art, and I received no information concerning the manner in which it is conducted.

17. Although almost every man among the natives who has dedicated himself to the art of war, and uses a musket, knows how to make gunpowder, there are some artists who prepare this substance, and construct fire-works. In this district I heard of 12 families of this kind, and saw some of them perform. They are far from being dexterous, but require little apparatus, and are easily satisfied.

18. A Portuguese trader at Dinajpur makes wax candles, a few of which are consumed by the natives at holidays, the remainder is exported. I have already mentioned, that he has a lease of the wax; part of this also is exported without being manufactured.

APPENDIX III—contd.

19. In Dinajpur five families are supported by making matches of bits of wood covered with sulphur; these are called *divoodais*.

20. Forty or fifty families of poor people are supported by making balls of charcoal dust, united by means of starch, which are used for burning the tobacco, that is smoked in the *hooqa*, or in other similar instruments.

21. Those who prepare the tobacco for being put into the pipe, are a much more important set of artists, and in this district they occupy between 7 and 8 hundred houses. They require very little stock, 4 or 5 rupees being sufficient. They take between 20 and 30 pounds of tobacco, dry it in the sun, and beat it in a wooden mortar, or with the *dhenki*. Then they dry it, and beat it with three-fourths of its weight of treacle (*kotra*). It forms a kind of cake or ball, and is sold by retail at all the neighbouring markets, as well as in the shop of the manufacturer. These balls keep for 10 or 12 days. Rich people use some other ingredients, but none is prepared in this manner for sale; it is done by the servants of those who use it. The artists are rather poor.

22. The people who distil spirituous liquors (*mod-uachh*) are of a very low caste, and the profession is opprobrious; but they seem to live easily, and require some capital. The demand is very inconsiderable, and of course the number of stills is small, and may be from one to two in each division. These stills are extremely rude, and are only employed to distil rice. The body (see drawing, No. 32), (a) consists of an earthen jar, which is placed over a hole in the floor (b) that serves for a fire place. An earthen pot (c) is luted to this by way of a head, a straight wooden tube (d) conducts from the head to the cooler (e) which is an earthen pot, that is placed in a pan filled with cold water (f); a man sits by the pan, and constantly pours water on the cooler with a coconut shell; another man supplies the fire. The whole apparatus is luted together, before the operation begins, and the distillation is continued until it is conjectured, that all the spirit has risen. The distiller then removes the lute, and takes away the cooler, which contains the spirituous liquor. It is scarcely possible to conceive any chemical operations so rude and imperfect. The liquor is never rectified nor re-distilled.

A manufacturer at Chintamon informed me, that he took 40 seers of rice (60 sicca weight or lb. 1 $\frac{3}{4}$, the seer) and boiled it, just as rice is usually prepared for the table; he then added $\frac{1}{2}$ of a seer of *bakor*, which is a mixture of dried herbs, that is prepared by a kind of people called *Jogis*, who collect the plants in the woods. It is said, that this contains 300 different plants. I had no opportunity of verifying this, but know, that a few plants are sufficient. The boiled rice and *bakor* mixed remain in a heap for six days, are then very mouldy, and in this state are called *bichan* or seed. This seed is put into a jar with 40 seers of fresh boiled rice, and 160 seers of water, and are allowed to ferment two days. The fermented liquor is then distilled by 10 seers at a time, and about $\frac{1}{2}$ part is drawn over:—that is, the 80 seers of rice, give about 40 seers of spirit. This man said, that the grains are not saleable. People will not give them to their cattle, and the only persons that will carry them away are basket-makers, who give them to their hogs. Each still pays a rupee a day as duty. I suppose chiefly with a view of discouraging the manufacture. The spirituous liquor thus prepared is execrable, but is not sufficiently strong to be inflammable. It is retailed by the distiller, and can be sold by no other person.

23. The oil-makers are a much more numerous and respectable class of trades-men, and as they require nearly the same stock for each mill, that a farmer does

for each plough, it is generally supposed that the profits of the two classes are nearly the same, mill for plough. The mill is indeed moved by one ox, but two must be kept for each, one to relieve the other, and the mill is much more expensive than the plough. This and the quantity of grain, that must be purchased, makes the oilman's capital rather heavier than the farmers; but there being no pretence for exactions on the part of the landlords, the returns being equally diffused throughout every week in the year, and above all there being no advances made for oil, the situation of the oilmen is, in general, preferable to that of the farmer. The mill is exceedingly imperfect, as will be seen from the drawing, No. 33. It is on the same principle with the oil-mill; but is much better fitted for the purpose of expressing oil.

In some divisions the oilmen are wealthy, and make advances to the cultivators for their mustard seed. In others they are more needy, and buy no more at once than will last them from one market-day to another. Others again receive the grain from the farmer, deliver a certain proportion of oil and for their trouble keep whatever more they can express from it, together with the cake.

In Ramsongkol, where the oilmen are richest and most numerous, and where they export a considerable quantity, I obtained the following account from one of them, a wealthy and respectable man. The mill receives at one time one *don* of seed (*turi*) which measures 421 cubical inches, and weights 152 $\frac{1}{2}$ ounces avoirdupois. A little water is added, and the mill grinds three hours, at first some seed comes from the spout, but afterwards, as this is thrown back, and as the cake forms, the oil comes away pure. It should amount to $\frac{1}{4}$ in weight of the seed, or to rather more than 47 $\frac{1}{2}$ ounces. The oil at present sells at 206 ounces for the rupee, and the seed at 2 $\frac{1}{2}$ annas for the quantity that is put at once in the mill. The value of the oil is almost 3 $\frac{1}{2}$ annas, so that he has 1 $\frac{1}{2}$ anna profit on each grinding, and the mill grinds twice each day. The cake is half the measure of the seed, and may be worth the 6th part of an anna.

At Dumdumah and Rajarampur it is reckoned, that the oil of *sorisha* should amount to $\frac{1}{4}$ of the seed, and the oilman are contented to grind, and return in oil $\frac{1}{5}$ of the weight of the seed which they received. A mill there grinds daily 12 seers of 96 sicca weight, or about 29 $\frac{1}{2}$ lbs. and produces very near 9 $\frac{1}{2}$ lbs. of oil, of which the oil-man gets $\frac{1}{2}$ part and the cake. Sometimes he grinds for pay, and for his mill receives 2 annas a day with about 2 $\frac{1}{2}$ ounces of oil.

At Potram it is said, that 30 seers of *sorisha* give only seven seers of oil, and that a mill in one day can grind 30 seers of 60 sicca weight, or about 46 $\frac{1}{2}$ lbs. The mills are usually employed by the day, and receive one anna in money, all the cake, and rather more than $\frac{1}{2}$ lb. of oil: worth in all about 2 $\frac{1}{2}$ annas a day, or Rs. 4.11 a month.

At Lalbazar, where there are a great many oil-mills, it is reckoned, that the capital required for each is double of that required for one plough. It is said that each seer of *sorisha* or *turi* gives $\frac{1}{2}$ seer of oil. Each mill can grind 15 seers of 58 sicca weight a day (or lbs. 22 $\frac{1}{2}$), and obtain rather more than 5 $\frac{1}{2}$ lbs. of oil. The usual price of seed is 75 seers or five days grinding for the rupee, which produces 27 $\frac{1}{8}$ lbs. of oil; and this selling at 10 seers the rupee, is worth R.I. 14. The gain is therefore 14 annas in 5 days, or R. 5 $\frac{1}{4}$ a month, besides the oil cake.

It must appear very remarkable, that these accounts should vary so much; some alleging that *turi* produces $\frac{1}{4}$ and *sorisha* $\frac{1}{5}$ or even less of its weight of oil; while others allege, that the latter gives $\frac{1}{4}$, and there is no doubt that the *turi* gives more than the *sorisha*,

APPENDIX III—contd.

In the only experiment, which I made, I procured $\frac{1}{2}$ of the oil from *sorisha* seed. I suspect, however, that the oilmen often cheat; pretend that the seed gives much less than it actually does, and keep the remainder to themselves; for Mr. Tucker informed me, that an oilman had offered to express *sorisha* seed for the cake alone. This cake no doubt would contain abundance of oil, which must have been afterwards expressed, otherwise the man could not have lived.

The number of families which follow this profession amounts to above 2,000, many of whom have more than one mill, and several, as many as five.

24. In this district most of the persons who prepare milk (*goyalas*) have no cattle, but live in towns, and keep only two or three cows like other persons in easy circumstances. They purchase the milk partly from poor farmers, and partly from those who have large herds of milch cattle. Their number may be between 6 and 7 hundred houses, and a man who has 25 rupees capital is considered as in a thriving way. In many places they have shops, and they attend at all markets to dispose of their commodities, which are boiled butter (*ghi*, or *ghrita*), curdled sour milk (*doyi* or *daahi*), butter-milk (*mat'ha* or *ghol*), inspissated milk (*khya*), and curd (*chhana*). The two last are made only when commissioned by the makers of sweetmeats, by whom alone they are used.

The first thing in general done with milk is to boil it, and the boiling is sometimes continued until the milk is reduced to a kind of extract called *khya*, which is used in sweetmeats. The natives use only boiled milk: the taste of this fluid, as it comes from the cow, is considered as unpalatable.

In a few parts of this district the milk, as it comes from the cow, is churned, and the butter is separated; after which the remainder is boiled, and made into *doyi* as usual: but in general the boiled milk is put into a pot, and there is added little old *doyi*, which occasions it to curdle and become sour. This is a favourite article of luxury with the natives, and butter is usually prepared by churning these sour curds or *doyi*. What remains, after the butter has been separated, is a kind of acid liquor (called *mat'ha* or *ghol*) which is analogous to our butter-milk, and is only used by the poor. The butter is never used without having been boiled, which converts it into an oil, that preserves much better than butter. Even in this climate it undergoes little change for one month, and may be used after having been kept a year. It is often adulterated by boiling *doyi* or sour curds along with the butter. This preparation of butter answers very well in cookery, and might perhaps be used in Europe to great advantage. The quantity consumed in the district is exceedingly small, and except in the largest towns none is ever made without being commissioned, so that it is not an article of common sale.

The *chhana* or curd is prepared by boiling the milk, and by adding to it, while hot, some acid milk, which coagulates the whole into one mass. This is put into a cloth, and the whey is expressed, so that it is a kind of cheese.

25. The people who prepare sweetmeats from curds are called *Moyras* among the Bengalee, and *Halwaikors* in western India. The artists of the two countries however keep totally distinct, and those of Bengal use most milk, while those originally from western India use more flour in their sweetmeats. In this district there may be about 100 houses of *Halwaikors*, and 120 of *Moyras*. They have capitals of from 15 to 20 rupees, and usually make four or five rupees a month. They all keep shops, and also expose their goods for sale at the common markets.

The *Moyra* prepare from sugar, curds and inspissated milk several kinds of sweetmeats (*nishtanno* vulgo *mitai*) called *monda*, *pengra*, *toki*, and *khynpadi*. They prepare others, called *roskora* and *monohora*, from coconut-kernels and sugar, others made of sesamum seed and sugar are called *tlakhaja* and *kodma*, and finally a kind called *batasa* is made of sugar alone.

The *Halwaikor* prepare sweetmeats, called *chhanabara*, from curds and sugar; those called *pantaoya* are made of flour and curds; those called *motichur*, *jialapi*, *goya*, *khaja* and *monbhog*, are made of flour and sugar; and the *cluchdana* is made of sugar and cardamum seeds.

These sweetmeats please neither the eye nor palate of Europeans, especially those made by the *Halwaikor*, all of which are fried in oil or butter. The rich natives use large quantities.

26. Maldeh was formerly celebrated for its *morobhha* or vegetables preserved in sugar or honey. The art seems to have been introduced by the Muhammedans from the west of India, and the fall of the Moslem power has reduced it to one practitioner. He preserves

Amlaki, Phyllanthus Emblica, W.

Hortoki, Myrobalanus Chebula, Gaertn.

Amra, Mangifera indica.

Anaros, Bromelia ananas.

Suphol, Cratava religiosa.

Kushmando.

Sotamuli.

Tetal, Tamarindus indica. The sight of these conserves perfectly satisfied my appetite. I cannot therefore speak of their flavour.

27. In Dinajpur three or four families, from the west of India, make sweetmeats called *paya* and *phulau*. The former is composed of the flour of rice mixed with molasses (*kotra*), the latter is composed of the flour of pulse mixed with the same sweet substance. The art has now become common in the district, and in country places each family prepares for its own use.

28. *Bhujans* are a class of people originally belonging to Bengal, as well as to the west of India, and about 600 houses are employed in this district. Seven or eight rupees are considered as a sufficient capital, and a family can make from two and half to three rupees a month. In large towns they keep shops, but in country places sell their goods in the open markets. These people make the preparations of rice called *khoyi* and *man* that have been already described; and they parch field pease and the pulse called *chona*, which form *motobhaja* and *chonabhaja*. All these, and also the preparation of rice already described under the name of *chua*, are mixed with extract of sugar-cane (*gur*), and sometimes with treacle (*kotra*), and are either formed into balls (*moya*) or into cakes (*chakti*), that are much used by the natives. The same persons also sell a mere mixture of *khoyi* with the extract sugar-cane, which is called *maiki*. Cakes made of sesamum seed and extract of sugar-cane are called *tlakhaja*. These same people take the cake extract of sugar-cane, and diluting it with water, boil it, and form two kinds of cakes, *patali* and *pheni*. The former is very heavy and the latter is light, but I have not learned the difference in the operation, only that some milk is added to the *pheni*, when it is boiling, which must in some degree purify the extract.

29. Some persons (*Dailhari*) in Maldeh and Dinajpur live by grinding wheat and by making *dail* from *kolai*, that is, by separating the integuments from the

APPENDIX III—contd.

grain of pulse. This is an art introduced from the west of India, but it has now become common, and except in large towns, is performed by the women of all families.

SECTION 2nd.—Artists employed in working durable materials, Wood, Earth, or Metal.

30. Under the synonymous names *Chhutor*, *Sutradhor*, and *Baran* we must include joiners, cabinet-makers, carvers, and carpenters of all kind. In this district there may be between six and seven hundred houses occupied by such persons. The greater part are merely employed to make the miserable instruments of agriculture, and occasionally a coarse stool or chest, and are among the poorest set of artists in the district. About towns, where a little furniture is used, and where some houses have wooden doors, window shutters, posts and beams, and where some palanquins are required, they live more comfortably, and make from four to eight rupees a month. A man who makes eight rupees must have 40 or 50 rupees capital, and employs some workmen. The following articles are those usually made at Dinajpur, with the usual extent of price from lowest to highest.

	Rs.	As.	Rs.	As.
<i>Meyana</i> , or palanquin,	10	0	20	0
Chests	2	0	10	0
<i>Toktoposh</i> , a bedstead with plank bottoms,	2	0	4	0
<i>Khat</i> , bedstead with ratan bottoms,	0	8	3	0
<i>Jolehauki</i> , bathing stools,	0	0	0	12
<i>Piri</i> , stools on which the natives sit when eating,	0	1	0	8
<i>Kursi</i> , a kind of chair,	0	4	0	8
<i>Meehan</i> , a kind of seat,	0	1	0	2
<i>Singhasan</i> , a throne for the images of the gods,	0	8	3	0
<i>Sepaya</i> , a wooden stand for a lamp or candle with three feet,	0	1	0	2
Mortar and pestle,	0	4	0	5
Spinning wheels,	0	0	0	2
Wooden-shoes, <i>khoram</i> ,	0	2	0	4
Plough without the iron,	0	4	0	6

The palanquin approaches to that of a Calcutta *beau*, about as much as a market cart does to my Lord Mayor's state coach, and the other articles are rude in proportion. Even this is not the greatest imperfection. The joinings are so badly fitted, that the furniture is very rickety and unfirm, a fault that extends even to the very neat workmanship, that is now made at Calcutta, Mongher, Patna, and other places, where European improvements have been introduced.

Oil and sugar-mills, *dhenkis*, and many other articles are made, when commissioned.

In this district the number of carpenters employed in building boats is very small; for although *sal* timber, fit for the purpose, may be readily procured from Nepaul and Bootan by the Mohananda, Atreyi, and the Korotoya, yet few traders keep large boats, as they could not be used during a great part of the year. A few trading boats however are built of *sal*: but until I reach some place, where the business is carried on to a considerable extent, I shall decline saying any thing on the subject, farther than that all the materials are furnished by the merchant, who builds the boat, and the carpenters are hired by the month. The

head workman is allowed seven rupees a month, inferior workman six rupees, and the lowest class three rupees. On the Jomuna river some boats are constructed of mango-wood. They are clinker built, and the fibrous roots of some aquatic plants, that grow in marshes, are used as caulking, being placed between the edges of the planks before these are nailed together. When moist these plants swell, and effectually prevent leakage. The boats last scarcely longer than two years.

One of the landlords, Baidyonath Chaudhuri, employs a few skilful men in carving figures of the gods on wood, but they have been brought from other districts. Their work is very rude, owing probably to the want of a good design, for they are capable of considerable neatness in execution.

The implements, which the carpenters have in this district, are the *begs*, a narrow hatchet; the *basuli*, a very good adze; *batali*, chisels of several kinds; the *tanda*, a very imperfect plane, which is designed merely for smoothing, and not for forming grooves of mouldings; the *korat*, a small wretched saw; the *turpon*, a drill moved by a bow and string; and the *munggur*, a mallet. The natives have neither auger, gimlet, rule, square, compass, nor bench, instead of which one man holds the timber, and another plains it, while it is placed on the ground, and both workmen sit on their heels. A few European tools have found their way to the town of Dinajpur, such as planes of various kinds, and the hand-saw, compass, rule and square.

31. Sawyers may occupy about 100 houses, and are in about the same circumstances with the carpenter. They are mostly Mahomedans, and generally work by the piece. At Dinajpur the sawing a log, about seven or eight cubits in length, into plank, about 1½ inch thick, was estimated at eight annas for every cubit of its circumference, which is the usual manner with these people of estimating the labour that a log will cost in sawing. This it is evident has no necessary connection with its solid contents, which the people of this district have no means of calculating. Sawyers are sometimes paid by the month, two men being allowed five rupees. The saw is about four feet in length, and its shape in an irregular curve. The handles are both fixed, so that the saw cannot be taken out without moving the wedges, which prevent the planks from impeding its motion. The teeth are very rudely formed, and are not bent alternately to the different sides, so as to make a cut sufficiently wide to admit of free motion; but the cutting edge of the saw is considerably thicker than back, which answers the same purpose. The log is not laid horizontally; one end rests on the ground the other is raised on a wooden horse, so as to form about half a right angle with the earth. This enables the man below to sit during a considerable part of the operation. The log is first marked with lines, and then one end having been cut, the other end is turned up for the saw.

32. Turners, *Kundkor*, are very few in number; I heard of only seven houses, and it is probable, that not above three or four could escape my notice. They work only in wood, and two men are always employed together; one who pulls a rope, first with one hand and then with the other, to turn the lathe, and one who applies the chisels. The two cheeks are fixed in the ground, and one must be dug out, every time that a new piece of wood is to be put into the lathe. The articles turned are:

1. Part of the spinning wheel.
2. Wooden platters, *burkosh*.

APPENDIX III—contd.

3. Wooden cups, *kotuya* and *bati*.
4. Wooden basons, *belon*.
5. Parts of the instruments used for smoking tobacco, *molicha*, *mol boitok*.
6. Rods carried by messengers, *horkora elhori*.
7. The feet of bedsteads.

Their wages and situation in life are like those of common carpenters. All those who work in wood have irregular employment, and are often very poor, although they have good wages when employed.

33. Potters, on the contrary, have a regular employment, and are as easy in their circumstances as any artists in the district. They require little or no capital, for whenever a kiln has been burned, the pots are sold for ready money to the petty traders, who retail them in markets. At Dundunah, where there are many potters, and these reckoned as good as any in the district, I took the following account.

There are two kinds of ware made; the one red, the other black: I shall first describe the red, as that is in most common use.

The clay used for this pottery ware is called *kabal*, is of a dirty livid colour, and is purchased from people who dig it, and bring it to the house of the potter, who, for liberty to dig the earth, supplies the officers of Government and the landlords with pots. This clay is watered, kneaded with the hands and feet, and beaten with a mallet. It is then made up into a mass, cut into thin slices, watered, and kneaded again. It is then fit for being placed on the wheel.

The wheels are of three kinds, one is about $1\frac{1}{2}$ cubit in diameter, and consists of four spokes and a rim of bambu, that are coated with clay, mixed with fibres of *pat*. It is about four inches thick at the centre, and two inches at the circumference. Neither of these kinds is baked. In the centre of each is a stone, in which a small cavity has been formed, and this rests on a pivot of tamarind-wood, that rises a few inches above the floor. A little clay is added, wherever wanted, in order to bring the wheel to an equilibrium. The third kind of wheel is but rarely used, and is made of the transverse cutting of a *sal* or jack tree, two cubits in diameter. Its motion continues longer, but the expense of even this is considered as a serious objection. The workman sits on his heels as usual, and gives his wheel a circular motion by means of stick, one end of which he places in a hole that is near the circumference. The motion communicated to the smaller wheels lasts only a short time and requires to be repeated two or three times for each vessel. Except the wheels the only implements required are a long knife, with a handle at each end, to cut the clay, a mallet to beat it, a few sticks and moulds and mallets of baked clay to shape the pots, and a string, or wire, to cut them from the wheel.

A great part of the ware, however, is not made on the wheel. The mouths only of the most common vessels used in cooking (*hanri* or *patil*) are made in this manner; the bottoms are merely kneaded, and then joined to the circular mouth. This part of the operation, and the drying of the pots in the sun, after they come from the wheel, is performed by the women; who also apply to the most conspicuous parts of their pots, a kind of pigment made of *ranga mati*. This is clay much impregnated with red ochre of iron, which is found in a great many places of the district by digging to a little depth, and contains small pebbles. Overnight, some of this is put into a pot, with much water. Next morning the water and finer parts of the clay are drawn off, and evaporated in the sun, until somewhat thick, like a pigment, which is applied with

a brush before the pots are quite dry, and when they are burnt, the parts that were so covered acquire a kind of metallic lustre. The pots having been dried six hours are fit for the kiln.

The manner of constructing the kiln is as follows: An oval cavity, see drawing No. 34, a, b, c, is made in the earth, which slopes gradually down to the centre, where a hemispherical cavity (f) about $2\frac{1}{2}$ cubits in diameter, is dug to serve as a fire-place at one side of this erected a semicircular wall of mud, (d, e,) which crosses the longest diameter of the oval at right angles, and is ten cubits long and six cubits high. Its bottom is perforated with a square aperture (g) through which the fuel is thrown. An arch of clay, (i, k, l,) is thrown over the fire-place, and is perforated in several places, to allow the flame and heat to reach the pots. This kiln lasts, with a few repairs, for a long-time and its construction does not cost a rupee.

The following is the manner of burning. The whole space of the larger segment of the kiln over the fire-place, and as high as the wall (ground plan b, c, d, e, longitudinal section d, m, e, l, t, transverse section d, b, k, e, e,) is filled with all the kinds of unbaked potters ware, that are in demand, after they have been well dried in the sun. The pots are covered with three inches of reeds (*ulac*), over which is placed earth two inches in thickness. The fuel is then thrown into the fire-place, and consists of small sticks and reeds (*burna*). The fire is kept up from sunset until midnight. The pots are taken out in the morning.

These pots are well burned, and are of bright brick colour, but they are very imperfect. They are brittle; and, having no glazing, imbibe so much grease in cooking, and are so rough, that they cannot be kept clean, although they imbibe a good deal of every liquor that is put into them, they are not sufficiently porous to admit of such an elevation as will cool water.

The clay used for making the black earthen-ware is called *kassa*, and is of a yellowish colour. It is prepared and formed into vessels, exactly as the livid clay is, the difference of colour in the two kinds of ware arises chiefly from the manner of burning. The kiln for the black-ware is smaller, the wall being only six cubits long by three high. The fire-place is of the same size. The pots, when placed in the kiln, are covered with three inches of straw; above which the ashes of straw are laid three inches thick, and are watered, which makes them cohere. The fire is applied at first slowly, and is then raised very high from sunset until midnight; when some dry cow dung is thrown into the fire-place, and the aperture is shut to confine the smoke, of which a great quantity issues from the dung. The pots are not taken out until the following afternoon. In fact, the colour seems to proceed entirely from the smoke, which enters the pores of the ware, and never can be entirely removed; but these black vessels are unfit for cooking, as boiling water always extracts some of the colour. They are more porous, and not so brittle as the red pottery, and their colour hides dirt. They are chiefly used as platters, and vessels for holding cold liquors; and sell about $\frac{1}{4}$ th dearer than the common red-ware.

It must be observed, that the want of glazing or enamel must always render the Indian earthen-ware a dirty kind of vessel; and accordingly no pure Hindu will use the same earthen vessel twice, but this custom, in itself proper, has been extended to the pottery of China and Europe, than which no vessels can be cleaner. This, it must be farther observed, is a complete bar to improvement. From a view of the drawings, (No. 35) the various articles commonly made will be seen, and it will be perceived, that the potters of this district are not destitute of taste in the forms of their

APPENDIX III—contd.

vessels; but the execution must necessarily continue wretched, so long as the prejudice against old vessels continues.

A potter, whose family consists of four men and two women, says that in each month he can burn five kilns of red-ware. Each kiln is worth about four rupees.

The expense is fuel, at 1 rupee a kiln,	Rs. 5 0 0
Clay 32 loads of about 98 lbs. for each kiln, at 10 annas,	Rs. 3 2 0
	Rs. 8 2 0

Leaving between 11 and 12 rupees a month for profit: this is probably somewhat underrated, as in such cases may be usually expected. Less cannot be allowed than four rupees for a man and women, who live as these people did, or three rupees for a man's labour, and one for a woman's; which would make the profit 14 Rupees, or about $\frac{1}{4}$ th part more than the potter stated. The number of potters in the district may be about 1400 houses. Besides making pots, a part of their profession, in several places of this district, is to dig wells.

This is the case, whenever the soil is light, as in such parts, in order to prevent sides from crumbling, recourse had two rings made of potter's ware. These rings are about six inches deep, and from 1½ to 1¾ cubits in diameter. The sides are about an inch or $\frac{1}{4}$ inch thick. The well is first dug about two cubits in diameter until water is found. The rings are then laid one above the other; and, as they are laid, the space between them and the sides is crammed with earth. A well of this kind lasts about five years without repair. Where the soil is stiff, the rings are not necessary, and potters are not employed to dig.

34. The worship of *Durga, Kali, Kartikeya*, and *Saraswati*, as performed by the Hindus of Bengal, and by these alone, requires a number of images made of unbaked clay, which, after the celebration of the religious ceremonies, are thrown into the river. In different parts of Bengal some other deities are worshipped in the same manner, but the custom does not extend to this district. This worship has given rise to a profession. Some who practise it are potters, and others are the makers of artificial flowers, who are at any rate employed in ornamenting the images, and the stages on which they are carried in procession. In some districts the artists of this kind possess very considerable merit, and mould in clay, with great neatness, whatever model is shown to them; and this might be employed as an excellent means of introducing a good taste among the natives. The images it is true, that are used in worship, require little attention, except to make them gaudy, as they cannot be baked, and are thrown into the river; but good models might be given to these artists, and very handsome moulds might be formed and baked, which would come very cheap, and be an excellent ornament for the houses and domestic chapels of the natives, so as by shewing them correct images, to wean them from the deformed objects which they now possess. The Mahomedans of this district are not behind hand in giving employment to those who make images; for rude clay images of horses are offered at the tomb of every saint, and these are baked. It would, however, be difficult to find out any workmen so rude as the image-makers of this district; nor did I conceive it possible, that any grown person could have failed so much in the imitation of nature. I shall therefore defer giving any account of the art, until I reach some place where it has arrived at some tolerable degree of perfection. The profession gives employment to about 80 families. They stain the earthen images of a red colour with the bark of the root of a wild

species of *Marrda*, called *chay-choka*. This, beaten with a duck's egg and some quicklime, forms a kind of red varnish, that is not easily removed.

35. Brick-makers did not constitute a trade of such importance, as to obtain a place in the establishment of Bollah-sen, and still are not numerous. About 120 families are acquainted with the process, and when bricks are wanted, engage to furnish any quantity, for which advances are made. On receiving the money they buy wood and hire labourers, whom they superintend and direct. Very often the fuel is furnished by the person who wants the bricks. The bricks are made in the open air, and of course can only be formed in the dry season; and if a heavy day's rain happens, very great losses are sustained. The earth chosen is the common free soil, which contains a large proportion of sand mixed with the clay. This is thrown into a pot with some water where it is allowed to soak for two or three days. It is then taken out, lumps are separated, and it is well beaten. It is then spread on a piece of ground that has been cleared and smoothed, and is laid on this of the thickness which it is intended that the bricks should have, which is usually about 1½ inch. When it has dried a little, a man takes a long bambu, which has the blade of a reaping-hook fastened to its end at right angles, and he draws this through the clay, keeping it straight by means of a traveller or noose which runs along a line stretched in the direction that is to be cut. He thus cuts the whole into bricks about 7½ inches long, by 6½ broad. Some days afterwards these are raised, and placed on their edges; after a few days more they are formed into walls, until a quantity sufficient for a kiln is ready. In one kiln one hundred thousand bricks are usually built, with alternate layers of wood and straw; and these being burnt, the operation is completed; 20 men take six weeks to prepare 100,000 bricks, and 14 days to burn them. I found that per each kiln the landlord paid 30 rupees in advance. He also furnished the fuel, and when the bricks were delivered he gave 40 rupees more. He did not however receive 100,000 bricks for 70 rupees and the fuel, for the bricks were numbered before they were placed in the kiln, and many are spoiled in the burning. The usual wages in the dry season being 1½ rupee a month for each labourer, the contractor had 10 rupees profit, besides his monthly hire.

The use of the mould was totally unknown to the native brick-makers, until introduced by Europeans. I have not learned, what difference it makes in the expense; but even the bricks made for a gentleman of Dinajpur with a mould, I observed, were very rough, and could not be employed to advantage for building a wall that was not covered with plaster. Those made after the native fashion are exceedingly rude, although well burned; and in all their finer buildings either coated with plaster, or incrusting with tiles, which are cut smooth, and are in general carved. The first plan is by far the cheapest, admits of all the ornaments of Grecian architecture, and looks fully as well as stone. It has accordingly been adopted in all European buildings.

The incrusting with cut tiles is exceedingly expensive, and never could be employed in any work of good taste; but it suits the native fondness for minute ornament and grotesque carving, and is employed in all the finer buildings of this district: I shall therefore give an account of it, which was taken from the best workman of the place.

The earth is of the same kind, and is prepared and cut in the same manner as for common bricks; only the pieces are larger, being usually four inches thick, 14 inches long, and nine inches broad. Some cow-dung is added to the fuel to increase the heat. The bricks,

APPENDIX III—contd.

when taken out of the kiln, are soaked a whole day in water, after which they are cut exactly square, and smoothed on five sides by means of small adze, with a short handle, and of chisels, which operation it is evident must be very expensive, and after all the bricks would not make such a smooth neat wall as those used in the south of England. The expense is however enormously enhanced by the carving on the flat side of the brick, which is often made to represent the fables of the Hindoo mythology; and gods, goddesses, princes, Europeans, animals, coaches, carts, ships, &c. &c. are also represented, and most miserably caricatured. Some Europeans imagine, that this is done with a view of rendering them ridiculous; but I am persuaded, that this is not the case, the god being no better treated than the sailor. It proceeds merely from want of skill and taste in the designer. Obscene figures make in general a conspicuous part. The bricks are carved with small chisels. After the operation is completed, the brick is first soaked in an infusion of tamarinds, and then a number is put into an iron vessel with about a pound of oil for each, and they are roasted over a fire until the oil disappears. The workmen are employed by the month, so that it is difficult to state the expense. Each brick goes through the hands of three artists; one cuts it square with an adze, his wages is five rupees, a second smooths the surface with a chisel and receives six rupees a month; the third carves the figures, and is allowed seven or eight rupees wages.

36. Brick-layers are about twice as numerous as professional brick-makers, and from being often unemployed make but poor wages, for they receive five or six rupees a month, when they work. Neither their walls, nor arches are neat, and their principal merit is in the application of plaster, either as a coating for walls to form a roof or floor, or as a cement to retain the carved tiles with which the walls are incrustated. The most approved composition used in this district is as follows:

5 parts of slaked lime in paste, (*koli-chun*)

10 parts of pounded bricks.

1½ part of Peungreek flour, (*Trigonella*).

½ part of thackum flour, (*Phaseolus Max*)

½ part of treacle, (*Kotra*)

5 parts of water, these are to be mixed with a trowel, and applied immediately.

37. There are several cutters of stones, or masons, in the employment of Baidyanath Chaudhuri, whom I have several times mentioned as the chief encourager of the arts in the district; but all these tradesmen have been brought from a distance, and even from Benares, and of course have high wages. One man in Dinajpur lives by forming weights of stone.

38. About 80 families live by collecting shells, and burning them for lime. I had no opportunity of ascertaining the kinds of shells; for the people have a peculiar aversion to collecting the objects of natural history, probably looking on the study as idle or absurd, and the employment as ridiculous. The shells are collected in marshes and rivers during the dry season, and if any considerable quantity is wanted, such as for building a house, advances must be made in due time; for in common the people gather no more, than serves the usual demand for chewing with betel, for dyeing and tanning, and for white-washing a few place of religious worship. Europeans in general procure stone lime from Silhet; but the landlords prefer the shell lime, as they can make the advances with little risk and trouble, and as they consider the lime better. I did not see the furnace. The lime is sold in three states by those who make it; 1st, slaked lime in powder,

called simply *chun* or *grungrochun*, sells usually at Dinajpur for three *mons*, (96 sa wt the seer, or 290½ lb.) for the rupee. This is used for mortar, and is made of shells that are not cleaned. 2d, *koli-chun*, which is slaked lime mixed with a great deal of water, and is that used for white-washing, and for making plaster. The shells for this are carefully cleaned before they are burned. 3d, *Laga* or *kadachun*, is reduced to a very white fine paste, and is used for chewing the bettle. This is made of some peculiar kinds of shells very carefully cleared.

39. In this district the working of the precious metals is at a very low ebb with regard to skill. The artists are sufficiently numerous, there being between four or five hundred houses inhabited by those who follow this trade. They are remarkably poor, and have no capital, except a few wretched tools, which they carry to the person's house, who wants any thing made, and who furnishes the materials. Their character for dishonesty is such, that a person must always watch to prevent them adulterating the bullion, after having secreted a part. In the account of the ornaments that are used by the people, will be seen the articles which these tradesmen make. All persons however who wish to be thought fashionable, bring their ornaments from Murshedabad or Calcutta when they can procure a trusty friend at these cities to superintend the making. The charge for workmanship, both of gold and silver, is from ¼ th to ½ th of the metal, so that when they work in gold, they should have vast profit, or very little when they work in silver; but there is probably some secret in this which those who employ them do not understand, for those who are sent to watch can only judge whether any silver is absolutely taken away in a metallic state. The natives seldom, if ever, use plate at their tables.

40. Among the natives of Dinajpur the various preparations and alloys of copper are in great demand, as must have been perceived in reading the lists of furniture and ornaments; yet the number of copper-smiths does not exceed one-half of the goldsmiths, for most of the ware is imported ready made, and artists are chiefly required to keep it in repair, whereas no one can trust to the purity of the gold or silver ornaments that could be purchased, and it is only people of fashion, who occasionally go to capital towns, that can procure gold ornaments from thence. In the base metals there is less danger. The imperfection of the workmen prevented me from taking an account of the manner, in which the alloys of copper are formed; a most interesting subject, to which I shall pay the most minute attention on the first favorable opportunity. The copper-smiths work in copper, brass, bell-metal, lead and tin; but there is a separate set of artists, who work in these two last alone. The copper-smiths almost always furnish the metals, and keep shops, where they retail their goods, and they also retail them in open markets. They therefore require a capital; from 50 to 100 rupees, however, are sufficient, as they purchase the metals in small quantities at a time, from the merchants who import them. In some parts of the country all the vessels are cast, in others they are all hammered. There are many persons, who retail the goods imported chiefly from Kungtoya, (Cutwa, R.) and Murshedabad, who are mere shop-keepers, and know nothing of the art. A copper-smith can clear between four and five rupees a month. Wrought brass costs from R 1-8 to R 1-14 the seer, according to the fashion. That which is cast is cheapest. Wrought bell-metal costs from 2-4 to Rs. 3. Wrought copper costs from 2-12 to Rs 3; the seer is of 80 sa. wt. lb. 2, 1000 avoirdupois.

41. In this district about 120 families of *thatara* are employed in making tin bracelets, which are worn by Mahomedan women of all ranks. They are nearly as

APPENDIX III—concl'd.

easy in circumstances as the copper-smiths, and require less capital, as they need no more metal at once, than will suffice from one market-day to another. Petty traders often purchase their goods, and retail them at markets.

42. One man from Puroiya makes *hooka* bottoms of a mixture of metals called *bidri*. I was very desirous of learning the art, because the alloy is said to consist of iron and lead, and is unknown to European chemists; but the man declined giving me any information on the subject.

43. Blacksmiths (*kama*) occupy between six and seven hundred houses, and are about in similar circumstances with the copper-smiths. When not otherwise engaged, they prepare with iron of their own, and retail at markets, the common implements of agriculture—such as the ploughshare, sickle, bill, hoe (*kodal*), hatchet (*kural*), *khonta*, and weeding iron. They also prepare in the same manner some household furniture, such as ladles, pothooks, kitchen knives, and lamps, both standing and hanging, and some coarse cutlery, such as knives, scissors, and beetle-nut-cutters; when ordered by the barber, they make his razors and nail-cutters; the former is an instrument very terrible to the patient. The European cutlery has made little way into this district. The blacksmith can also prepare an instrument called *kajollota*, which is placed over the lamp for collecting the smoke used as a paint, he also makes locks and padlocks, possessed of every imaginable defect, and can make such tools as the carpenters use. A few tradesmen at Ghoraghat, chiefly the remains of a number who were formerly at that place, can make arms, such as matchlocks, swords and spears, but most of the arms now in the district are imported. The blacksmiths also make nails and clamps for boat-builders; but the quantity required being small, and the demand irregular no such thing as a nail can be procured ready made. If one is wanted, it must be commissioned. The hoes made near Nawabganj are reckoned good, and the manufacture employs several people, that receive advances from traders, who send the hoes to neighbouring markets. The greatest labour, how-

ever, which the black-smiths of this district undertake, is to make boilers for those who prepare the extract of sugar-cane, or for the manufacturers of sugar: an estimate of one of these latter boilers of the smallest kind weighing six maunds of 60 sa. wt. the seer, lb. 369½ will give some idea of the state of the art. The sugar-manufacturer furnishes 12 maunds of Birlhum iron, one half of which is consumed in working. This costs from 36 to 39 rupees, according to the rate of the market. Six men working constantly can make a boiler of this size in a month, and receive 24 rupees or four rupees a month each. But such expedition is not usual; they more commonly require two months, and work only a part of each day at this heavy labour. The remainder is employed at small jobs for their usual customers, or in making some of the small articles which are sold at markets; thus 269½ lb. of iron, very rudely wrought, cost from 60 to 63 rupees, of which [this are the price of labour.

In this district one black-smith cannot work by himself, he must have a man to blow the bellows, and he has usually an assistant to work with a large hammer; the man who manages the forceps and small hammer is the chief. The proportion of their pay is eight annas for the forceps, five annas for the large hammer, and three annas for the bellows. The two former sit on their heels, and cannot be said to display great activity; but the creature who manages the bellows may be considered as the quintessence of indolence. The bellows, except in being too small, are not badly contrived, and are made somewhat like too common pair of kitchen-bellows, joined by the muzzles, and far separated at the other extremity. These bellows are placed vertically, and on the back board of each is a button, which the workmen takes between his toes, and lying quietly down on his back, moves the boards backwards and forwards with his feet.

44. In Dinajpur and Maldeh are five or six men, who may be called cutlers. They clean arms, especially swords, and two or three of them have wheels for sharpening knives and razors.

CENSUS TRACTS, VILLAGE SAMPLE POPULATION AND DISPLACED PERSONS

Preparatory to the sorting and tabulation of census information, rural and urban areas of a district were grouped into Census Tracts on the basis of instructions issued by the Registrar General of India. These tracts had to have the approval of the Registrar General of India before sorting and tabulation began. A list of rural and urban tracts of West Dinajpur grouping rural thanas and urban areas is given below. In the body of the statistics they are referred to by their code number.

RURAL

R—83	Hili (excluding town) Balurghat (excluding town) Kumarganj	R—85	Bansihari Kushmandi Kaliaganj
R—84	Tapan Gangarampur	R—86	Hemtabad Raiganj (excluding town) Itahar

URBAN

U—34	Hili Balurghat Raiganj
------	------------------------------

A ' Village ' in the book is identical with a cadastrally surveyed ' mauza ' bearing a jurisdiction list number.

In several tables the term ' Sample Population ' has been used. This sample was drawn according to the following instruction of the Registrar General of India. Enumeration was done on pads of 100 slips each, a slip containing the record of an individual:—

“ Break each pad and stack the slips of the pad; and ' cut ' the stack as in a card game. Place the lower portion above the upper portion and then deal the slips into the pigeon holes. You should deal the slips into pigeon holes in the order of 1, 2, 3, 4, 5, 6, 7, 8 and 9 successively. All the time, you should watch the slips of ' Displaced Persons.' If you come across any slip of a Displaced Person deal it in the pigeon hole of ' Displaced Persons.' ”

CENSUS TRACTS, VILLAGE SAMPLE POPULATION AND DISPLACED PERSONS—*concl'd.*

Hence it will be seen that the sample is not a sample of the total population but of the latter excluding the 'Displaced Population.'

The check factors for the sample population are:—

1000 S/G Rural Total=57,657,000/526,046=109.60

1000 S/G Urban Total= 2,161,000/ 19,199=112.56

1000 S/G District Total=59,818,000/545,245=109.71

A 'Displaced Person' was defined by the Registrar General of India as follows:—

"A 'Displaced Person' means any person who has entered India having left or being compelled to leave his or her home in Western Pakistan on or after the 1st March 1947 or his or her home in Eastern Pakistan on or after the 15th October, 1946 on account of civil disturbances or the fear of such disturbances or on account of the setting up of the two dominions of India and Pakistan."

The population is divided into two broad livelihood categories, *viz.*, the Agricultural Classes and the Non-Agricultural Classes. Each category is divided into four Classes as below:—

Agricultural Classes—

I—Cultivators of land wholly or mainly owned and their dependants

II—Cultivators of land wholly or mainly unowned and their dependants

III—Cultivating labourers and their dependants

IV—Non-cultivating owners of land; Agricultural rent receivers and their dependants

Non-Agricultural Classes—

Persons (including dependants) who derive their principal means of livelihood from—

V—Production other than cultivation

VI—Commerce

VII—Transport

VIII—Other services and miscellaneous sources

T stands for Total, R for Rural and U for Urban. Those Police Stations which are not classified by T, R and U have an entirely rural population.
 * Excludes the towns of Balurghat and Raiganj with areas of 2.46 and 3.58 square miles respectively and with population of 18,121 and 15,473 declared as such only in 1951. The percentage variation has been calculated on the absolute figures of 1931, 1941 and 1951.
 (a) Area provided by Surveyor General, India, through Registrar General, India. The total of areas of subdivisions will differ from this figure.
 (b) Area derived from Jurisdiction Lists and confirmed by the Director of Land Records and Surveys, West Bengal. Calculations of density are based on this figure.
 (c) Covers all of Hili Police Station.
 (†) Not declared as town in 1931.
 (‡) Not declared as town in 1931 and 1941.

TABLE 1.9—ECONOMIC TABLE I—LIVELIHOOD CLASSES AND SUBCLASSES

(NOTE—This table classifies the population first into *Agricultural and Non-Agricultural Classes* and next into eight *Census livelihood classes by principal means of livelihood and shows under each class how many are selfsupporting, non-earning or fully dependants, and earning or partly dependants.*)

FOOD INDUSTRIES OTHERWISE UNCLASSIFIED	2.0	189	51	138
Canning and preservation of fruits and vegetables	2.01	4	4	..
Canning and preservation of fish	2.02
Slaughter, preparation and preservation of meat	2.03
Other food industries	2.00	185	47	138
GRAINS AND PULSES	2.1	1,802	767	1,035
Hand pounders of rice and other persons engaged in manual dehushing and flour grinding	2.11	898	223	675
Millers of cereals and pulses	2.12	645	302	343
Grain parchers and makers of blended and prepared flour and other cereal and pulse preparations	2.13	241	241	..
Other processes of grains and pulses	2.10	18	1	17
VEGETABLE OIL AND DAIRY PRODUCTS	2.2	157	135	22
Vegetable oil pressers and refiners	2.21	125	104	21
Manufacturers of hydrogenated oils	2.22
Makers of butter, cheese, ghee and other dairy products	2.23	32	31	1
SUGAR INDUSTRIES	2.3	2	2	..
Gur manufacture	2.31	2	2	..
Other manufacturers and refining of raw sugar, syrup and granulated or clarified sugar from sugarcane or from sugar beets	2.30
BEVERAGES	2.4	25	14	11
Brewers and distillers	2.41	11	..	11
Toddy drawers	2.12	5	5	..
Ice-manufacturers	2.43	2	2	..
Manufacture of aerated and mineral waters and other beverages	2.40	7	7	..
TOBACCO	2.5	520	501	19
Manufacture of bidis	2.51	520	501	19
Manufacture of tobacco products (other than bidis) such as cigarettes, cigars, cheroots and snuff. Stemming, re-drying and other operations connected with preparing raw leaf tobacco for manufacturing are also included	2.50
COTTON TEXTILES	2.6	116	112	4
Cotton ginning, cleaning and pressing	2.61
Cotton spinning, sizing and weaving	2.62	116	112	4
Cotton dyeing, bleaching, printing, preparation and spooling	2.63
WEARING APPAREL (EXCEPT FOOTWEAR) AND MADE-UP TEXTILE GOODS	2.7	323	300	23
Tailors, milliners, dress makers and darners	2.71	301	288	13
Manufacturers of hosiery, embroiderers, makers of crepe, lace and fringes	2.72	11	1	10
Fur dressers and dyers	2.73
Hat-makers and makers of other articles of wear from textiles	2.74	2	2	..
Manufacture of house furnishing of textiles	2.75	5	5	..
Tent makers	2.76
Makers of other made-up textile goods, including umbrellas	2.70	4	4	..
TEXTILE INDUSTRIES OTHERWISE UNCLASSIFIED	2.8	385	357	28
Jute pressing, baling, spinning and weaving	2.81	320	303	26
Woolen spinning, twisting and weaving	2.82
Silk reeling, spinning and weaving	2.83	38	38	..
Hemp and flax, spinning and weaving	2.84
Manufacture of rayon, weaving of rayon fabrics and production of staple fabric yarn	2.85
Manufacture of rope, twine, string and other related goods from cocoanut, aloes, straw, linseed and hair	2.86	16	14	2
All other (including insufficiently described) textile industries, including artificial leather and cloth	2.80	2	2	..
LEATHER, LEATHER PRODUCTS AND FOOTWEAR	2.9	253	249	4
Tanners and all other workers in leather	2.91	22	21	1
Cobblers and all other makers and repairers of boots, shoes, sandals and clogs	2.92	221	218	3
Makers and repairers of all other leather products	2.90	10	10	..

TABLE 1.12—LIVELIHOOD DIVISIONS, SUBDIVISIONS AND GROUPS—*contd.*

	I.C.E.C. Group No.	1951			
		Total	Males	Females	
LIVELIHOOD CLASS V—contd.					
DIVISION 3—PROCESSING AND MANUFACTURE—METALS, CHEMICALS AND PRODUCTS THEREOF		464	455	9	
MANUFACTURE OF METAL PRODUCTS, OTHERWISE UNCLASSIFIED		3.0	319	311	8
Blacksmiths and other workers in iron and makers of implements		3.01	265	257	8
Workers in copper, brass and bell metal		3.02	17	17	..
Workers in other metals		3.03	31	31	..
Cutlers and surgical and veterinary instrument makers		3.04	6	6	..
Workers in mints, die sinkers, etc.		3.05
Makers of arms, guns, etc., including workers in ordnance factories		3.06
IRON AND STEEL (BASIC MANUFACTURE)—Manufacture of iron and steel, including all processes such as smelting and refining; rolling and drawing; and alloying and the manufacture of castings, forgings and other basic forms of ferrous metals		3.1	34	33	1
NON-FERROUS METALS (BASIC MANUFACTURE)—Smelting and refining, rolling, drawing and alloying and the manufacture of castings, forgings and other basic forms of non-ferrous metals		3.2	40	40	..
TRANSPORT EQUIPMENT		3.3	53	53	..
Building and repairing of ships and boats		3.31	16	16	..
Manufacture, assembly and repair of Railway equipment, motor vehicles and bicycles		3.32	26	26	..
Manufacture of aircraft		3.33
Coach builders and makers of carriages, paliki, rickshaw, etc. and wheel wrights		3.34	11	11	..
Manufacture of all other transport equipments		3.30
ELECTRICAL MACHINERY, APPARATUS, APPLIANCES AND SUPPLIES		3.4
Manufacture of electric lamps		3.41
Manufacture of electric fans and other accessories		3.42
Manufacture of electric wire and cable		3.43
Manufacture of electrical generating, transmission and distribution apparatus, electrical household appliances of other than lights and fans; electrical equipment for motor vehicles, aircraft and railway locomotives and cars; communication equipment and related products, including radios, phonographs, electric batteries, X-Ray and therapeutic apparatus; electronic tubes, etc.		3.40
MACHINERY (OTHER THAN ELECTRICAL MACHINERY) INCLUDING ENGINEERING WORKSHOPS—Engineering workshops engaged in producing machine and equipment parts		3.5	4	4	..
BASIC INDUSTRIAL CHEMICALS, FERTILISERS AND POWER ALCOHOL		3.6	5	5	..
Manufacture of basic industrial chemicals such as acids, alkali salts		3.61
Dyes, explosives and fireworks		3.62	5	5	..
Synthetic resins and other plastic materials (including synthetic fibres and synthetic rubber)		3.63
Chemical fertilisers		3.64
Power Alcohol		3.65
MEDICAL AND PHARMACEUTICAL PREPARATIONS		3.7	1	1	..
MANUFACTURE OF CHEMICAL PRODUCTS OTHERWISE UNCLASSIFIED		3.8	8	8	..
Manufacture of perfumes, cosmetic and other toilet preparations		3.81
Soaps and other washing and cleaning compounds		3.82	7	7	..
Paints, varnishes and lacquers and polishes		3.83
Ink		3.84
Matches		3.85
Candle		3.86	1	1	..
Starch		3.87
Other chemical products		3.80

DIVISION 4—PROCESSING AND MANUFACTURE—NOT ELSEWHERE SPECIFIED		3,485	3,475	310
MANUFACTURING INDUSTRIES OTHERWISE UNCLASSIFIED	4.0	182	180	2
Manufacture of professional scientific and controlling instruments (but not including cutlery, surgical or veterinary instruments)	4.01			..
Photographic and optical goods	4.02			..
Repair and manufacture of watches and clocks	4.03	14	14	..
Workers in precious stones, precious metals and makers of jewellery and ornaments	4.04	364	362	2
Manufacture of musical instruments and appliances	4.05	42	42	..
Stationery articles other than paper and paper products	4.06	1	1	..
Makers of plastic and celluloid articles other than rayon	4.07			..
Sports goods makers	4.08			..
Toy makers	4.09	4	4	..
Other miscellaneous manufacturing industries, including bone, ivory, horn, shell, etc	4.00	57	57	..
PRODUCTS OF PETROLEUM AND COAL	4.1	1	1	..
Kerosene and petroleum refineries	4.11	1	1	..
Coke ovens	4.12			..
Other manufactures of products from petroleum and coal	4.10			..
BRICKS, TILES AND OTHER STRUCTURAL CLAY PRODUCTS—Structural clay products such as bricks, tiles, etc.	4.2	1,256	1,155	101
CEMENT—CEMENT PIPES AND OTHER CEMENT PRODUCTS—Manufacture of cement, cement pipes and cement concrete products	4.3	1	1	..
NON-METALLIC MINERAL PRODUCTS	4.4	356	285	71
Potters and makers of earthen ware	4.41	314	276	68
Makers of porcelain and crockery	4.42			..
Glass bangles, glass beads, glass necklaces etc.	4.43	3	3	..
Makers of other glass and crystal ware	4.44			..
Makers of other miscellaneous non-metallic mineral products; lime burners	4.40	9	6	3
RUBBER PRODUCTS	4.5	5	2	3
WOOD AND WOOD PRODUCTS OTHER THAN FURNITURE AND FIXTURES	4.6	1,302	1,169	133
Sawyers	4.61	27	27	..
Carpenters, turners and joiners	4.62	647	644	3
Veneer and plywood makers, match veneer and splint makers	4.63	37	37	..
Basket makers	4.64	442	329	113
Other industries of woody materials, including leaves, but not including furniture or fixtures	4.60	149	132	17
FURNITURE AND FIXTURES—Manufacture of household, office, public building, professional and restaurant furniture; office and store fixtures, screens, shades, etc., regardless of material used	4.7	44	44	..
PAPER AND PAPER PRODUCTS—Manufacture of paper and paper board and articles of pulp, paper and paper board	4.8
PRINTING AND ALLIED INDUSTRIES	4.9	38	38	..
Printers, lithographers, engravers	4.91	35	35	..
Bookbinders and stitchers	4.92	3	3	..

		Total	Males	Females
LIVELIHOOD CLASS VI—concl.				
RETAIL TRADE IN FOODSTUFFS (INCLUDING BEVERAGES AND NAR (OTICS)	6.1	4,283	3,936	327
Retail dealers in grains and pulses; sweetmeats, sugar and spices; dairy products, eggs and poultry; animals for food; fodder for animals; other foodstuffs, vegetables and fruits	6.11	2,529	2,255	274
Vendors of wine, liquors, aerated waters and ice in shops	6.12	261	261	..
Retail dealers in tobacco, opium and ganja	6.13	127	124	3
Hawkers and street-vendors of drink and foodstuffs	6.14	97	59	38
Retail dealers in pan, bidis and cigarettes	6.15	1,269	1,257	12
RETAIL TRADE IN FUEL (INCLUDING PETROL)	6.2	195	192	3
Petroleum distributors	6.21	22	22	..
Retail dealers (including hawkers and street-vendors) in firewood, charcoal, coal, cow dung and all other fuel except petroleum	6.20	173	170	3
RETAIL TRADE IN TEXTILE AND LEATHER GOODS—Retail trade (including hawkers and street-vendors) in piece goods, wool, cotton, silk, hair, wearing apparel, made-up textile goods, skin, leather, furs, feathers, etc.	6.3	1,121	1,111	10
WHOLESALE TRADE IN FOODSTUFFS—Wholesale dealers in grains and pulses, sweetmeats, sugar and spices; dairy products, eggs and poultry; animals for food, fodder for animals, other foodstuffs, wholesale dealers in tobacco, opium and ganja	6.4	647	645	2
WHOLESALE TRADE IN COMMODITIES OTHER THAN FOODSTUFFS	6.5	232	227	5
REAL ESTATE—House and estate agents and rent collectors except agricultural land	6.6	56	56	..
INSURANCE—Insurance carriers and all kinds of insurance agents and other persons connected with insurance business	6.7	19	19	..
MONEYLENDING, BANKING AND OTHER FINANCIAL BUSINESS—Officers, employees of joint stock banks and co-operative banks, Minims, agents or employees of indigenous banking firms, individual moneylenders, exchangers and exchange agents, money changers and brokers and their agents	6.8	249	248	1
LIVELIHOOD CLASS VII (Transport)		1,661	1,600	61
DIVISION 7—TRANSPORT, STORAGE AND COMMUNICATIONS		1,817	1,751	66
TRANSPORT AND COMMUNICATIONS OTHERWISE UNCLASSIFIED AND INCIDENTAL SERVICES	7.0	78	75	3
TRANSPORT BY ROAD—Owners, managers and employees connected with mechani- cally driven and other vehicles (excluding domestic servant) palki, etc., bearers and owners, pack elephant, camel, mule, ass and bullock owners and drivers, porters and messengers, persons engaged in road transport not otherwise classified, including freight transport by road, the operation of fixed facilities for road transport such as toll roads, highway bridges, terminals and parking facilities	7.1	1,135	1,110	25
TRANSPORT BY WATER—Owners and employees, officers, mariners, etc., of ships plying on the high seas, ships and boats plying on inland and coastal waters, persons employed in harbours, docks, rivers and canals, including pilots, ship brokers	7.2	129	116	13
TRANSPORT BY AIR—Persons concerned with airfields and aircraft other than construction of airfields and air ports	7.3	16	16	..
RAILWAY TRANSPORT—Railway employees of all kinds except those employed on construction works	7.4	303	283	20

TABLE 3.2A—MEAN DENSITY (PERSONS PER SQUARE MILE), CULTIVABLE AND CULTIVATED AREAS, IRRIGATION, RAINFALL AND DISTRIBUTION OF CROPS

Figures relate to the year 1949-50

Mean Density of 1951 (Persons per square mile)	Total Area (acres)		Area cropped more than once annually (acres)	Annual Rainfall		Area under (acres)					
	Cultivable	Cultivated		Normal *	Average 1941-50 †	Rice	Other cereals and pulses	Jute	Fruits, vegetables including root crops	Sugarcane, drugs and narcotics	Fodder, oilseeds and other crops
520	777,300	633,800	86,000	63.86"	65.77"	574,800	40,800	30,400	9,800	3,900	60,100

*Normal of current year is not available. Normal rainfall figure supplied by the Meteorological Department before the partition of the Province and which is being used in our rainfall publications is now furnished above.

†Figures for the district are calculated by taking an unweighted arithmetical average of the figures published yearly during 1941-50 as the district annual average rainfall. This district annual average is itself unweighted average of the annual rainfall of all the observatory stations within the district for which normal rainfall figures are on record.

N.B.—†Total area cultivated=Net area sown+current fallows+cultivable waste land.

Total area cultivated=Net area sown, i.e., net area irrigated.

N.B.—†Total cultivated area has been taken to be gross cropped area. (Figures relate to the year 1949-50).

*Negligible.

Summer crops include :—Summer rice and summer til.

Winter crops include :—Autumn rice, Winter rice, Jowar, Bazra, Maize, Ragi, other Kharif cereals, Kharif pulses, Winter til, Jute, Sunnhemp and other fibres, Bhadoi Fodder, Sugar crops, Bhadoi fruits and vegetables.

Spring crops include :—Wheat, Barley, other Rabi cereals, Pulses other than Kharif pulses, Oil seeds other than Til, Cotton, Tobacco, Potato, Rabi fruits and vegetables, Rabi fodder.

Miscellaneous crops include :—Condiments and Spices, Tea, miscellaneous Food, miscellaneous Non-food and Unchona.

TABLE 3.13—FREQUENCY OF FLOODS AND DROUGHTS—1891-1950

Method of Computation

The period considered is from 1891 to 1950, i.e., 60 years. For each year the total rainfall during the season "May to October" (average rainfall recorded at all the stations in the district) was computed. From the 60 values of seasonal rainfall the "normal rainfall" was calculated. Now the rainfall in any particular year (i.e., during May to October) will deviate from the "normal rainfall". These deviations were computed for each year. From the 60 deviations the "mean deviation" (disregarding sign) was calculated.

Definition of "Flood" and "Drought"

If the actual rainfall during May to October in the district was in excess of the "normal rainfall" by $1\frac{1}{2}$ times the "mean deviation" or more, that year is called a "Flood" year. On the other hand if the actual rainfall was in deficit by $1\frac{1}{2}$ times the "mean deviation" or more, that year is called a "Drought" year. If the actual rainfall lies between (a) normal rainfall plus $1\frac{1}{2}$ times the mean deviation and (b) normal rainfall minus $1\frac{1}{2}$ times the mean deviation, the year is reckoned as a normal year.

Frequency of "Floods" and "Droughts" in West Dinajpur

The following statement indicates the incidence of "Floods" and "Droughts" in each year in the district during the period 1891 to 1950. In any year in which the rainfall of the district has been more or less normal (neither Flood nor Drought) the space will be a blank.

1891—D	1901—D	1911	1921	1931	1941
1892	1902—F	1912—F	1922—F	1932	1942
1893	1903	1913—F	1923	1933	1943
1894	1904—D	1914	1924	1934	1944
1895	1905	1915	1925	1935	1945
1896	1906	1916	1926—D	1936	1946
1897	1907	1917	1927	1937	1947
1898	1908—D	1918—F	1928	1938—F	1948
1899—F	1909	1919	1929	1939	1949
1900	1910—F	1920	1930	1940—D	1950

Normal Rainfall—66.2"
Mean Deviation—10.4"
Limit for Abnormality—15.5 (i.e., $1\frac{1}{2}$ D)

F—For Flood
D—For Drought

Number of Floods in 60 years—8
Number of Droughts in 60 years—6
Total number of Abnormalities—14 (i.e., Floods and Droughts)

TABLE 6.3—DIRECTORY OF HIGH SCHOOLS

Note on compilation—The Census Department framed a questionnaire which the Director of Public Instruction addressed to all schools. The replies were tabulated and this table is based solely on the returns received from schools. No attempt has been made to check the returns with the records of the Education Directorate. The information furnished by each school is therefore without authoritative verification.

ANCIENT MONUMENTS AND FAIRS

TABLE 10.1—GLOSSARY OF THE BETTER KNOWN ANCIENT MONUMENTS IN WEST DINAJPUR DISTRICT

A. Sadar Subdivision

1 *P. S. Kumarganj*

About 14 miles north of Balurghat on the Balurghat-Kumarganj Road at Biswanathpur (J.L. 146). A group of old dilapidated temples of the Paucharatna and Nabaratna types with carved terracotta decoration. Also a *dolmancha*. Also traces of an old mud fort at Khorda Mohana (J.L. 119) immediately to the north of Biswanathpur (J.L. 146).

2 *P. S. Tapan* (J. L. 63, Tapan—J.L. 64 Kasba). About 14 miles west of Balurghat on the Balurghat-Tapan Road.

A very fine tank, named Tapandighi, perhaps the largest in the district; for the water seems to have extended 4100 feet from North to South and 1150 from East to West, and the space occupied by the tank is about 300 feet wide, making the total dimensions 4700 feet by 1750. On the east and west sides have been three entrances through the bank, each had a descent to the water (*Ghat*) lined with brick. On the south side have been two entrances and on the north side one; opposite to this is a small heap, probably the ruins of a temple. About half a mile to the west of the Tapandighi is a space of about half a mile in extent called Patharpunji (J.L. 68 Kazibhag), broken with small tanks, like the situation of a town; and near the northern extremity of this is a large heap of bricks, covered with soil once probably a temple of considerable size. Beautifully ornamented and carved terracotta tiles can still be salvaged with a little endeavour and several beautiful specimens can be seen at the library of the Prachya Bharati at Balurghat. These tanks are said to have been made by Ban raja, and to have been the place where he performed his religious ceremonies (*tarpan*) and where he swung before Siva for 1000 years, suspended by hooks passing through the skin of his back.

(a) Daudpur (J.L. 70) on the Tapan-Kardaha road, about 2½ miles west of Tapandighi. Remains of an old arched bridge can be seen.

(b) Kardaha (J.L. 30) about 6 miles west of Tapan—near the Punarbhaba river. Celebrated as having been the place where Krishna burned the 998 arms of Ban raja, which he had cut off in battle. Contains an 18th century brick temple of the Dinajpur Raj.

(c) Manahali (J.L. 50) About 3 miles north-east of Kardaha. Celebrated as the area where the famous *Manahali* plate inscription was discovered.

(d) Bhikhahar (J.L. 184) About 2½ to 3 miles south of Kardaha. Ruins of a very ancient group of brick temples with terracotta bricks containing figures of animals, birds etc. The writer has made a gift of several remarkable specimens to the Asutosh Museum where they may be seen.

(e) Bhaior (J.L. 188). About 1½ miles south-west of Bhikhahar. The torso and head of an enormous Sandstone *Dasabhuja Durga* on a raised mound. This is a remarkably large image.

(f) Dwipkhandia (J.L. 140). About 1½ miles east of Tapan. The entire mauza is studded with high mounds and ridges suggestive of buried ruins.

3 P. S. Gangarampur

About 20 miles from Balurghat on the Balurghat-Kaliaganj road. A full description of the ruins is given below from Francis Buchanan Hamilton's account. The mauzas are:

- (a) J.L. 84 Rajibpur for Bangarh or Bannogor
- (b) J.L. 86 Puranpara for Dhaldighi
- (c) J.L. 94 Ramchandrapur and J.L. 97 Raghunathbati for Kaladighi
- (d) J. L. 36 Narayanpur and J.L. 82 Kalighat for Daudamuna

All are within a radius of 1½ miles of Gangarampur thana.

"The proper name of Dumdumma is Devi Kot. It received its present appellation (which signifies the place of war) from its having been a military station during the early Muhammedan government, as it probably was then on the frontier; for I have already mentioned, that the province called Barendo extended no farther north than this place. While the troops were stationed at Dumdumma, the chief officer, under the title of Wazir, seems to have resided on the banks of a very noble tank, which is named Dahal Dighi, and has evidently been formed by Muhammedans: its water being about 4000 feet from E. to W. and 1000 from N. to S. It is probably exceedingly deep, as the banks thrown out are very large. They have been a good deal spread, and from many irregular rising grounds, finely planted; and surpass in beauty any thing of the kind that I have ever seen. On many different parts, especially towards the N. E. corner are heaps of bricks, probably the ruins of the houses that were occupied by the Moslem officers. On the centre of the north side is the monument (*Dargah*) of a saint (*Pir*) named Mullah Ata-ud-din, contiguous to which is a small mosque. Both are very ruinous, but a canopy is still suspended over the tomb, which is much frequented as a place of worship and the fakir has an endowment of 200 biggahs (about 100 acres) of land. The present occupant is a remarkably handsome man, and has a perfect formed arabian countenance, although his ancestors have held the appointment for several generations. A descent, paved with stone, leads down from these buildings to the tank, and the materials have been evidently taken from a ruin, as broken columns, parts of doors, windows, and stone variously carved, are intermixed with such as are quite plain. Traces of the human form on the pedestal of a column shew that the ruins from whence they were taken have been those of a Hindu building, and confirm the tradition of the supply having come from Bannogor. The wazir, who is reported to have founded the mosque and to have dug the tank, is said to be buried between them, and a large cavity covered by long stones is shown as his grave. From an inscription over the gate of the mosque, it appears, that it was built before the time of Ata-ud-din, and of Shekh Mukbu (another saint), by Wazir Shair Musaur of Mozofurabad, Commander of the troops of Firuzabad, in the reign of Hoseyn Shah, Sultan of Hostina, son of Mosofur Shah, A.H. 718. From an inscription under the former, it would appear, that a place for prayer (*Gombuz*), which has been erected behind the tomb, was built by the order of Sekandar Shah, son of Majahud Shah, son of Ayas Shah, A.H. 765. Also from an inscription in a wing of the mosque, it would appear, that this was erected as a place of prayer of Ata-ud-din by Futeh Shah, son of Mahmud Shah, A.H. 854. A part of the mosque, called Hamada, from an inscription in it, was built in the reign of Kykaos Shah, by the order of Sakandar Sani, or the 2nd, A.H. 872. Finally, from an inscription over the door of an apartment to the right of the mosque, and which was a kitchen for the use of fakirs, it would appear, that it was built in the time of Mukhdum Mullah, when Mozofur Shah was king. The date is no longer legible. At a little distance east from Dahal Dighi is another tank of very large dimensions, called Kala Dighi and supposed to have been dug by Kala rani, the spouse of Ban raja, exclusive of the banks it is about 4000 feet long from N. to S. by 800 feet wide.

"North from the tanks called Dahal and Kala are many small ones, which formerly in all probability were in the suburbs of Bannogor, the residence of Ban raja, of whom I have already given an account.*

* Available in another appendix in this volume.

“The ruins of Bannogor occupy the east bank of the Punabhoba, which here runs from N.E. to S.W. for about two miles, beginning a little above Dumdummah. I first examined the citadel, which is a quadrangle of about 1800 by 1500 feet, surrounded by a high rampart of bricks, and on the south and east by a ditch: the remainder of the ditch has been obliterated or destroyed by the Punabhoba, which in the time of Ban raja is said to have passed to the north of the present course of the Brohmani; and many large water-course, which are to be seen in that direction, render the tradition probable. On the west face of the citadel is a large projecting part, probably the outworks before the gate. In the centre is a large heap of bricks said to have been the raja's house; and on the east face is a gate and a causeway, about 200 feet long, leading across the ditch into the city, which has been a square of above a mile in diameter, and has been also surrounded by a rampart of brick, and by a ditch. Towards its S.E. corner is the monument of Sultan Shah, which is ruinous; but a *fakir* has a small endowment, and burns a lamp before the tomb. The monument is much frequented by the faithful, and contains many stones, which from their position have evidently been taken from ruins, and pillars are of the same order with those at the mosque of Dahal Dighi. They are somewhat more elegant than those at Adinah, and I have procured a drawing of one (No. 9)*, and of a door (No. 10)*, which, I have no doubt, belonged to Bannogor.

“Near the monument of the Muhammedan saint are the two celebrated pools Omrito and Jivot, which I mentioned in my account of Ban raja. In their present state they are very different from the pools of life and immortality, which their names imply, as they are filled with abominably dirty water. They have never been large but the size of the heaps of bricks round them shown that they have been surrounded by large buildings; and probably they have been sacred ponds (*Pushkorinis*), which occupied the areas of two temples. The women of the vicinity who have been unfortunate in their children, and have lost many by death, frequent these pools, and carrying with them two living fish of the kind called Kamach Singgi, bathe in each pond, and make an offering of a dish.

“In Omrito a projecting stone was pointed out as the dead cow that had been thrown into the water by the infidel Yovons, in order to deprive it of its virtues. I proposed to take it out, which excited a smile of contempt in my guides, who assured me, that one of the Dinajpur rajas had tied ropes to it, and with three elephants had attempted in vain to procure this monument of antiquity. The pandit attached to the survey, who is perhaps somewhat of a philosopher, went next day with a dozen men and some ropes, and pulled it out with some degree of exultation. He found it to be an image of the bull Vrisho, which is usually worshipped by the sect of Shiva, and which the infidels very probably threw into the pond. This and the image of Gones now at Dinajpur, which I have already mentioned, together with the custom of swinging attributed to Ban raja, pretty clearly show the religion of that tyrant (*Osar*) who opposed Krishno, as the temples of Shiva constructed by Ravan, which I have seen in the south of India, point out the worship of the opponent of Ram.

“At the N. W. corner of the ruins of the town, near the Punabhoba, are the remains of the monument of another Muhammedan saint, Pir Havakhari, which also have some columns, and other stones: and the same *fakir* who lights the lamp at the tomb of Sultan Shah attends on this, which is also much frequented by the devout.

“Near this the river has undermined part of the ruins, and is encroaching on a thick bed of bricks, in which stands a column of granite of the same order with those in the monuments of the Muhammedan saints.

“At a very little distance from the N. E. corner of the city is a large heap of bricks, said to be the ruins of a temple dedicated to Virupakhyo (*Shiva*) by Ban raja. In the time of Raja Ramnath of Dinajpur, two religious men were informed in a dream where the

* Not reproduced—A. M.

image was concealed, and hastened to inform the raja of their discovery. He accordingly sent people with the two good men, who pointed out the place in the ruins, and on digging there was found a *Linga*, for which the raja built a small temple, and settled 360 biggahs (about 180 acres) of land, with a monthly pension of 30 rupees on the two brahmuns, whose children now enjoy the fruits of their ancestors' virtue. It is said and believed in the neighbourhood that this image, when discovered, was a cubit high. It has since gradually diminished, and is now reduced to a span. The new temple is very ruinous, and the brahmuns who have the endowment will probably wait for a repair, until another dreamer can procure another raja, who will perform that work of piety. It is now, however, the chief place of Hindu worship in the division.

“About half a mile west from the north end of the city, on the opposite side of the Purnabhoba, is a considerable heap of bricks, overgrown with bushes, and placed on the side of a small tank. For any thing that appears to the contrary, this, as is related, may have been the house of the princess Usha, whose fondness for Oniruddho brought about the destruction of her father and native city.

“About three-fourths of a mile beyond this heap, and on the other side of the Brohmani, is a place called Narayonpur, where there are many small tanks and heaps of bricks like an old town. This is said to have been the field where the great battle took place between Krishno and Ban raja. Near one of the tanks, evidently of Hindu construction, is the monument of a Muhammedan saint, Pir Baha-ud-din, from whence to the tank is a large pavement and stair, constructed of stones, that have evidently been taken from ruins. Near it is a small building of brick, much ornamented with carving, and which from its resemblance to the mausoleum of Ghyas ud-din, at Pernya, probably contains the tomb of some person of rank.

“The great number of stones in these ruins, and a vast many that have been removed by the Dinajpur rajas, to construct their works, show that Bannagor has been a place much ornamented and its walls show that it was of considerable size and strength. The people here allege, that all the stones which are to be found in the buildings of this district have been carried from it, and that Gaunr owed its most valuable materials to the ruins of Ban raja's edifices.”

B. Raiganj Subdivision

1. *P. S. Bansihari*

At Bansihari on the bank of the Tangan a large heap of very beautifully carved stones was still to be seen in 1951 which from their appearance suggested that they had been brought over from Pandua in Malda district.

The ruins in the police station are thus described by Buchanan Hamilton. The mauzas are:

(a) Bansihari—J. L. 259 Sibpur

(b) Gopalpur—J.L. 123. About 5 miles north of Malam which is at mile 28 on the Balurghat-Bansihari-Malda road.

There is an old mosque at Gopalpur a little off the road.

(c) Maliandighi—J.L. 112. About 3 miles west of Gopalpur

(d) Gourdigghi—J.L. 106 Khayerbari

(e) Altadighi—J.L. 4 Chenti Mahespur.

About 1½ miles south-west of Maliandighi.

The Malam-Gopalpur road appears to be a very ancient road paved with old brick, and there are the remnants of an old arched bridge. Ekdala Bahirhata is just outside the jurisdiction of Bansihari.

“DIVISION OF BANSIHARI

“In this division there is no place of worship of any note, but there are several antiquities near the thana, at about half a mile south from this place is a small Hindu temple, called

a *Mondir*, a work apparently of considerable antiquity. Its base is a quadrangular prism, about 20 feet high, and 12 wide. Its summit is a pyramid of about the same height. This part of the building has been much ornamented with carved bricks, especially a kind of escutcheon on each face, that possesses some degree of good taste. The artists have been ignorant of the method of constructing an arch; for the door is contracted above, to a point, by the horizontal rows of bricks gradually encroaching on its width; not the smallest tradition remains concerning its founder, and the image has been removed.

“ At a little distance west from this *mondir* begins a narrow elevated ridge of land, perhaps half a mile wide, which extends west to the Beliya about two miles, and seems to me entirely artificial. It is every where full of small tanks, inequalities, and heaps, many of which consist almost entirely of bricks. The largest of these has been lately opened, probably in part to look for hidden treasure, and in part to procure bricks for building an office (*kuchery*), for collecting the rents, and this latter view has not been in vain. The building has probably been a temple, in form of a polygon. The outer wall is about four feet thick. At the western end of this elevated space are two tanks of considerable dimensions, which are almost filled up, and entirely choked with weeds. The place is called Brojbollobhopur, and I have no doubt has been a considerable town; but no tradition remains.

“ About 1½ mile west from the Beliya, is a very large tank, called Melandighi, which is nearly choked with weeds. The only tradition concerning it is, that it was dug by a princess (*Rani*), and that a miracle was necessary to procure water. About 1¼ mile further west is Gordighi, a tank, the water of which was extended about 600 yards N. and S. and 400 yards E. and W., and which of course is a Hindu work. A considerable portion of it has now so far filled up, that it is cultivated for rice. About 1,200 yards west from this tank is another, called Altadighi, which extends nearly to the same dimensions, but is placed with its greatest length from east to west, and therefore is a Muhammedan work. Between these two tanks are the ruins of Borohata, (Bairhata. J.L. 5) which are very large heaps or mounds, that consist in a great measure of bricks. In many places the foundations of walls may be traced, and even the dimensions of the chambers. All these chambers are of a small size, owing to which they may have resisted the attacks of time better than more spacious apartments. They are chiefly situated in the southern division of the town called Kutwari. In this part are some small tanks that have evidently been entirely lined with brick. In the centre of the ruins are indubitable traces of a small square fort, which has been surrounded by a double wall of brick, and an intermediate ditch. The ruin to the north of this fort is almost entirely without the trace of regular form, but the quantity of bricks which it contains is great. At its northern extremity is the monument of a Muhammedan Pir, Badul Dewan, which is built of brick; in its gate are two stones, but there is nothing about them to determine, whether they have been brought by the founders, or taken from the ruins. There is no sort of tradition concerning the persons who either founded or destroyed these works.

“ I observed also in this division, on the road towards the S.E., two places where there were small tanks, and heaps of earth and bricks, which may have been towns; but there was nothing about them which indicated their ever having been places of considerable importance.”

2 P. S. Kushmandi

(a) Mahipaldighi (J.L. 190). About 10 miles north-east of Bansihari on the Bansihari-Dinajpur Road. A description of Mahipaldighi is quoted below from Buchanan Hamilton. There are traces of an old indigo factory where William Carey first settled down to work.

(b) Panchanagar (J.L.217). About 2 miles south-east of Mahipaldighi. Site of an ancient Hindu city.

- (c) **Ekdala Bahirhata (J.L. 39).** This mauza is near the extreme south-western corner of the thana.

Francis Buchanan Hamilton records the following:

"In the N. E. part of this division is a very large tank, supposed to have been dug by Mohipal raja, and called after his name (Moybuldighi R.). The sheet of water extends 3800 feet from N. to S., and 1100 from E. to W. Its depth must be very considerable, as the banks are very large. On the bank are several small places of worship, both Hindu and Moslem, but none of any consequence; nothing remains to shew that Mohipal ever resided either at the tank, or at Mohipur, near it; but there is a vast number of bricks, and some stones, that probably belonged to religious buildings, that have been erected by the persons who constructed the tank. One of the stones is evidently the lintel of a door, and of the same style with those at Bamagor, and may have been brought from the ruins of that city. The people in the neighbourhood have an idea, that there has been a building in the centre of the tank; but this is probably devoid of truth, as there is no end to the idle stories which they relate concerning the tank and Mohipal. Both are considered as venerable, or rather awful, and the raja is frequently invoked in times of danger. A canal and road, formed from the earth, thrown out, leads south from the tank, about four miles, where they join others leading east and west, but to what distance I did not ascertain."

3 *P. S. Kaliaganj.*

An east-west high ridge starts west of Kushmandi towards Kaliaganj called the Ushaharan road, supposed to be the road taken by Aniruddha when he eloped with Usha the daughter of Ban raja. Traces of a long ridge can be identified right across Kaliaganj and Itahar to Churaman. It is possible that Buchanan Hamilton was exploring somewhere near this ridge when describing the ruins of Borogang in Kaliaganj Division as follows:

"DIVISION OF KALIYAGANJ

"The only remains of antiquity that I saw or heard of it at Borogang, in the southern part of the division. These are several mounds, consisting of bricks, covered in a measure with soil, and extending about 30 yards in diameter. Near them are many small tanks, like those of a Bengal town. On one of the mounds is situated the tomb of a Muhammedan saint, surrounded by a brick wall. The *fakir* says, that it was built by one of the Bengal kings, which is very probable; but his authority is as nothing, for he was a poor illiterate creature, with a silly show of devotion. Even while I was speaking to him, he continued to mutter prayers and to sob forth pious ejaculations. Around the monument (*durgah*) are a good many stones, like those at Hemtabad, but less ornamented. There is no tradition concerning the founder of the ruin. I have no doubt of its having been a Hindu edifice, and that the monument has been built from its materials."

4 *P. S. Hemtabad*

The following account of Buchanan Hamilton still holds good. The mauzas concerned are:

- (a) Hemtabad (J.L. 81), on the Kaliaganj-Raiganj road
- (b) Kantor (J.L. 82).
- (c) Sonabanda (J.L. 80).
- (d) Kasba Mahaso (J.L. 176 P. S. Raiganj).

"DIVISION OF HEMTABAD

"By far the most celebrated Muhammedan place of worship, either here or in the vicinity, is near Hemtabad, and is a (*Durgah*) monument, dedicated to Mukhdum Dokorposh, where the saint's tomb is shown, and where there is a small rude mosque of stone, adorned

with pillars and carvings, which, it is evident from their containing human figures, have been taken from Hindu buildings. In the market-place at Hemtabad, the same saint has a monument, which is much frequented on the day appropriated for the commemoration of his name; and near his own mosque, which was adjacent to his house, he seems to have erected another in memory of Kotub Shah, who was the most holy personage in the reign of Ghyas-uddin, as Dokorposh seems to have been in the reign of Sultan Hoseyn. The mosque of Kotub Shah has also been ornamented with stone pillars, the spoil of infidels. Four *fakirs* attend the mosque of Dokorposh, which is in tolerable repair, as well as the tomb, but the other buildings are quite ruinous. They have 500 bighas of land, free of rent, but it is of a wretched soil. This mosque, from an inscription over the gate, would appear to have been built in the year of the Hegira 996, by Sultan Hoseyn.

“ At Baliyadighi is a mosque near a tank, which has an endowment of 1000 bighas of land; and the *fakir*, who has the hereditary charge, lives in a brick house, and in a decent manner. There is no Hindu place of worship of any note.

“ The antiquities of this district are rather interesting and are situated immediately west from Hemtabad. It is said that formerly there governed at this place, a Hindu raja, named Mohes, to whom much of the neighbouring country was subject. During his government, a certain Muhammedan saint (*Pir*), named Buzerudin, came and sat down at his gate, where he seems to have been but coldly received. Soon after, came a still more celebrated person, Mukhdum Ghuribal Hoseyn Dokorposh, and the raja immediately fled to Dhaka, which he is said to have founded. The *Pir*, I should suppose, was accompanied by an army, but tradition by no means supports this conjecture. On the contrary, it is said, that the raja fled merely because he was shocked at the destruction which the two barbarian saints and their attendants committed on innocent cattle and poultry; Mohes, therefore, was probably very different from the Hindu rajas of the present day, as indeed all rajas of former times are said to have been. A Muhammedan saint, in these days, who attempted to kill a cow in a Hindu country, would run great risk, unless he was protected by an army. In support of my opinion, I must mention, that soon after Mohes had been expelled by the saints, Sultan Hoseyn appears to have been at the place, and gave his daughter in marriage to Mukhdum-uzi-uddin, brother to Dokorposh. The son by this marriage, Mukhdum Shah Bazit, is said to have retired to Sondwip, and took up his abode there; but his son Jamaludin returned here, and was buried near his grand uncle. In the inscription on his tomb, it must be observed, that he is called Jamaludin, son of Sheykli Yahia. On the whole I am inclined to believe, that Mohes raja was sovereign of this part of the country, which, not being included in the provinces of Barondro or Maithilo, did not probably belong to the kingdom of Gaur, until the time of Hoseyn the conqueror; and this territory may have been the country called Kamacah, which he added to his dominions. Having premised so much on the history of the place, I shall now describe its present appearance.

“ Near a tank, a little way west from Hemtabad, there is a space of ground about half a mile in diameter, over every part of which bricks are thickly scattered, and in some places the foundations of walls may be traced. In some places, this is thickly covered with trees and bushes, and in others, it is clear: at the northern end is a small hill, formed of bricks, and said to have been the public office (*Kuchery*) of Mohes raja. On the surface are a good many large squared stones of which material, probably, a considerable part of the building consisted. South from that, about 100 yards, is a still larger heap of ruins, and here also are several stones, one of which, apparently the lintel of a door, is a good deal ornamented. This ruin is said to have been the raja's house. Immediately south from this heap are shown the foundations of a small square apartment, made of brick, in the centre of which is a tomb, said to be that of *Pir Buzerudin*. The door of stone is still erect, and as will appear from the drawing, (No. 2)* has been handsome. From the figures on it, the workmanship is, no doubt, Hindu, and in all probability, it has been a door in the raja's house; at the south

* Not reproduced—A. M.

- end of the ruins are the mosques and adjacent buildings, which I have no doubt, have also been built from the materials of the raja's abode. A door in the outer wall has still more perfect figures, than that which has been drawn; and the figure on the lintel strongly resembles the image of Gautama and his two favourite disciples, as usually represented in the temples of Ava. The pillars are remarkably clumsy, quite in the Hindu style; and being all of different forms and lengths, could not have been originally intended for the places which they now occupy. Besides, on a stone lying near the mosque is carved a human figure, quite entire. I have given a drawing of this building, (No. 3)* as being one of the most entire in the district.

“ About a mile and a half beyond this ruin is another, which has been surrounded by a brick wall, and is usually called the *Tukht* or throne of Hoseyn (*Padshah*) the king. The *tukht* consists of a quadrangular truncated pyramid, of about 20 feet in perpendicular height, and is composed of bricks heaped confusedly together. Intermixed with these are some large carved stones, evidently of the same style as those of Mohes raja's house; but whether they have been brought from thence, or whether they are the ruins of a temple, that formerly may have been on the spot, I cannot say. On the summit of this pyramid is a considerable square area, in the centre of which a terrace has been raised about three feet high; and this has been regularly built with cement, and its sides have been ornamented with mouldings covered with plaster. It was here, it is said, that Hoseyn Shah sat, and beheld sports which were exhibited at the nuptials of his daughter. South from the pyramid are the ruins of a brick building, the roof of which has fallen in, but the walls are standing, and have been encrusted with carved bricks. The building is nearly square, with arched doors and windows, and is elevated on a brick terrace about five feet high. This is said to have been the house that was erected for the accommodation of the princess during the ceremony, after which the whole seems to have been given to religious men. The tombs of two saints (Weleat and Bahador Shahs) now occupy the throne of the king, and many tombs of saints and fakirs surround the pyramid. There is a small endowment of land for supporting the fakir who supplies the lamps burned at the tombs of the most distinguished of these personages.

“ Between the two ruins many bricks are scattered on the fields, and a very wide road, with a ditch on each side, may be traced most part of the way.”

5 *Itahar*

1 Churaman (J.L. 164). The ancient port of Chudaman said to be still unidentified by Dr. R. C. Majumdar in Vol. I of History of Bengal.

* Not reproduced—A. M.

TABLE 10.2—LIST OF IMPORTANT FAIRS AND MELAS

Sl. No.	J. L. No.	Name of place where mela or fair is held	Time (English month) when mela is held	Local religious or other occasion of the mela	Duration of mela or fair (No. of days)	Average total attendance

VILLAGE DIRECTORY

This directory renders an account of each Village and each Ward of a Town entered on the Jurisdiction Lists for each thana maintained by the Director of Land Records and Surveys, West Bengal. It gives the J. L. number, name, and area of the village, and where inhabited, its number of occupied houses, population, number of literates, with the livelihood of the population classified into eight major livelihood classes of which four are agricultural and four non-agricultural. The four agricultural livelihood classes are :—I—Cultivators of land wholly or mainly owned and their dependants, II—Cultivators of land wholly or mainly unowned and their dependants, III—Cultivating labourers and their dependants and IV—Non-cultivating owners of land; Agricultural rent receivers and their dependants. The four non-agricultural livelihood classes are persons, including their dependants, who derive their principal means of livelihood from V—Production other than cultivation, VI—Commerce, VII—Transport and VIII—Other services and miscellaneous sources.

The villages or towns of a thana are grouped under its name and the total of each column has been struck for each thana with an account of its rural and urban population. Thanass have been arranged according to the census code serial.

Symbols will frequently be seen against the name of a village or town, and they indicate that the institution which the symbol denotes is physically situated within the village. The symbols are :—

P	denotes	Primary School
S	„	High English School
H	„	Hospitals, A.G. or F.R.E. Hospitals
D	„	Dispensaries
Rh	„	Rural Health Centres
P.O.	„	Post Offices
M.A.	„	Municipal Area

Where figures like 5P or 2S or 2H, etc. occur they denote that the mauza or town has five Primary Schools or 2 High Schools or 2 Hospitals etc.
